Seriously!

I remember someone mentioning that you could have the posts on the
Falcon case drilled and fitted with brass inserts so the problem of
knackered threads wasn't a problem anymore.

Where can I get this done? After having had to go into it three or four
times, and despite extra-extra care being taken, I noticed the dread
powery residue of plastic when I opened it to try a 3Gb drive (didn't
work. *sighs* I'm figuring that if HHDriver isn't seeing an IDE device,
it's dead).

Mk. X cases are a little too expensive for me to recase it just yet ;)

Richard

>
>So, the transfer to/from the FPU is greater than the DSP? They

Unlike the DSP, the FPU is not really a separate processor. It doesn't
run a program of its own, but rather gets told about some instructions
that the '030 doesn't know about itself (this is done in hardware).

>wouldn't run concurrent with the main processor? If that's right, what

It really is part of the processor, in a way. It just didn't fit on the
same chip. The same was true for the external MMU on the 68020 (which
was handled in exactly the same way).
In the '040 and '060, these things did fit (in a cut down form) on the
same chip and the coprocessor interface was removed.

Just as for the later chips, the 68881/2 FPUs _can_ run in parallel with
the CPU's integer engine to a limited degree. As I said, they get their
instructions from the same program code, though.

Anyway, the only way using an FPU can help with the IDCTs of JPEG
unpacking is if the FPU can do floating point multiplies enough faster
than the CPU can do integer multiplies. For some modern chips that is
true (especially considering that they can often deliver the result of
one float multiply per second, thanks to pipelined multipliers).
The data is in integer format originally, however, and needs to be
turned back into that afterwards, so the speed difference needs to be
significant for there to be any benefit from the FPU.
The 68881/2 is just plain slow (about ten times slower than the FPU in
the 68040 for simple operations).

Draconis probably crashes because the site's markup is crap. It doesn't even come close to HTML 4.0 adherence, being so riddled with errors. (CAB understands the core features of HTML 4.0, so that's really not an issue here.) And to make matters worse, parts of the markup are written in XML: mixing this with HTML, although very similar in syntax, isn't allowed. The site also uses Cascading Style Sheets, riddled with errors too. There are no Java applets -- just JavaScript for simple image rollovers. CAB of course ignores the JavaScript and CSS, which aren't integral to the page, but it's a wonder any browser can plow through the garbage and make something appear. It's ironic that a site committed to accessibility is itself so poorly written, not adhering to other web standards.

Only the stuff that's on the motherboard is usually supported that way.
You'd normally load new drivers to be able to access a sound card or CDROM.
Then of course there's the problem that DOS drivers aren't necessarily
available at all. You might need Windows running to access a device (or
to make decent use of it, as in the case of graphics cards).

>>Well, one should be enough, but STonX, being 100% C, isn't one of the

They must be since people here are claiming that their Hades'/Milan's
are much faster than a decent PC with an emulator. ;-)

>Btw. do you have any opinion on TOSBox (needs only a minimum DOS, handles

Not really since I've only tried it a few times (did not run in a Window).

>well high resolution, and behaves OK with NVDI, Mint, multitasking, etc) ?

I just tried it out again here and it crashed my machine twice when I
tried to stop it (I guess I should boot from my Win2k or Linux partitions).

Anyway, I reran two of the tests I posted about earlier and TOSBox turned
in times that were about 50% slower than my Falcon+AB040.
Now, I may not have configured TOSBox properly, but if that's what
people usually judge emulation performance by, I can understand why
they think it's slow.
As I mentioned earlier, GEMulator2000 was 4-5 times faster (3 times
faster than my Falcon+AB040 rather than 50% slower).

>>(The FPU test in GEMBench puts GEMulator at 14 times the speed of an
>> FPU-less Falcon (this is really an integer test for machines without FPU
>> (which includes all the emulators, AFAIK)).)

>
>I don't quite understand this. Do you mean to say that all floating-point
>operations reduce to integer ones? So a pair of integer/floating tests

If there isn't an FPU (which there isn't in any of the emulators I know
about), GEMBench does the same calculations using integer operations,
just like it would be done in any non-FPU-aware program.
Obviously, any floating point operation can be done with integers (after
all it's all ones and zeros (well, low and high voltages) to the computer),
just slower on equivalent hardware.

The reason why I mentioned the 14* figure was that it fits very well in
with the fact that my AB040-machine is usually 3-5 times faster than a
plain Falcon and the PC was 3 times faster: 3-5 * 3 = 9-15.

>would always give the same speed ratio regardless of the machine.

I don't think I follow you there.

GEMBench doesn't really do anything approaching a decent integer test
(the 'divide' test certainly isn't one!). The closest it comes are the
'VDI enquiry' (when using the exact same VDI on all machines compared)
and 'float' (when on a machine without FPU) tests.

>But that makes floating point ops no less real on a higher level.

When there is no FPU in the computer, the GEMBench float test does not
try to use any FPU instructions. They are not real in any way then.

>So it seems that a "software-only" solution (i.e. a good emulator on a PC
>confugured for high speed) can bear with any currently available clone-

At least according to my tests.

>and be much simpler to implement. I would like to see a new PPC-based
>Atari clone, but I am afraid that a project like that would be an economical
>disaster and therefore not likely to succeed. So using Intel-cpu

Well, the Tempest is likely to arrive, but that's of course no a clone.

>boards seems to be the only reasonable alternative. If it can be argued
>that "OS-is-a-platform" there is no particular reasons (except religious)

But religion is what being an Atari user is all about! ;-)

Anyway, I don't really care one way or the other. I continue to use the
computers I like and buy the ones I'm interested in (I've got somewhere
around two dozen).

I wouldn't buy a clone unless it was really different in some way, say
using dual PPCs or something like that. I'd just as soon use an emulator
on a PC otherwise, and I don't even do that.
If I'd been able to use a decent graphics mode with GEMulator, I might
have used that since it's obviously much faster than my Falcon. Until I
can convince the author that it is in his best interest to add the little

extra functionality that would allow for a decent fVDI decive driver,
that's out of the question, however (I've exchanged a couple of emails
with him regarding this, actually, but nothing has come of it yet).
Accelerators are another matter, since then I can still use my beloved
old Falcon. ;-)

Yes that is exactly what I found so entertaining about this site.
They even have a test to validate your page and get a banner you can
display to show youre site meets up to their exacting standards ;)

It all gets explained as you go through the site and see that one
of their corporate sponsors is microsoft ;)

It is a very bad page. That's why I thought it was a good test.
As long as my schedule doesn't go too insane with the rest of the day, I hope to get an update to my OVL released taht can navigate this site, to the limit of CAB's happiness. To be honest the only reason it works for them is probably because they have the autosearch url function on in IE that allows IE to try and make sense of the page. The have misdirections on graphics etc from what I can tell.

So hopefully in the next 24 hours you will be able to use my
CAB.OVL to validate your website and show everyone how you live up to the exacting standards of Bobby ;)

I recommend you install Odd's mmu tools, this will split the ram
into st ram an tt ram, and sets stram in such a way that if
you have some troublesome app, like xcontrol that crashes in
ttram, simply set it to load into stram. And stuff set to load
into ttram will run flat out fast.

Unless you are running MiNT-Net+N.AES my setup details will
probably not be that useful.

I am however using the ATI Rage Pro with nvdi 5.03 with the
special drivers from Medusa.

> be amazed...

Does the demo version of MagicMac have some kind of slowdown routine on it
as a demo limitation? I know the PC version at least at one time did. When I
tried the demo on my 350MHz G3 iMac, benchmark programs said it was running
on average about 7x the speed of an ST, and software didn't seem to run all
that fast. This isn't a whole heck of a lot faster than my Nemesized Falcon.
Hopefully it would be better in the full version? If this is the case, it's
too bad they did this. I'd like to see just how much of a speed increase I'd
get before I consider spending my money, or wasting my money, depending on
the outcome. At any rate, my Falcon won't be replaced by it until it's dead
beyond repair and there are no more Falcons out there to buy.

FamilyNet Newsgate

Hello Uwe!

US> The maximum partition size for TOS 1.04 is 256 MByte.
> Anything else is definitely wrong.

I guess TOS referrs to the whole bundle, but out of interest do you know if the limitation is in GEMDOS or BIOS? I'm guessing GEMDOS because I currently run 1.04 on a PC and it reads a 2Gb partition without problems. I'm guessing that the emulator replaces BIOS. Of course, on a real ST that's academic, the whole thing is in ROM anyway.

I would be interested in knowing how that 256Mb limit comes about. Is it a Cylinders, Heads, Sectors thing like the imfamous PC 528Mb ATA limit, or a 19 bit field somewhere for the number of sectors in a partition?

Regards,
- Andy.

1770. CAB.OVL ver. 1.4300 released

Newsgroup: comp.sys.atari.st
Date: 2001-02-04 21:07:36 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a7dc498$1_1@athena.netset.com>
Source record: 50702

As promised version 1.4300 of my CAB.OVL is now available for
download at my website.

http://www.netset.com/~baldrick/ovl.html

Changes:

OVL now parses leading blank lines from the beginning of files.
So some HTML files that were displayed as text before are now properly
displayed as HTML. This does not get fix all files that may have this
problem, but should get a large number of them.

Dan Ackerman
aka baldrick

ps. I expect to see lots of Bobby certification now ;)

Bruce S <brew@paradisewebdesign.net> wrote:
>Ok, I've tried switching the the "LAN" port in the STing CPX's and it says
>it fails everytime. Why would it fail? I saw Dan Ackerman say something

I'm not certain about the STiNG CPX, but there is a bit that has
to be switched in the system to address it properly. The "LAN" port
shares itself with "Serial 2" on the TT. So you have your choice of which
you want to use, but you only get to use one.

>about if you have a video card that they may be disabled???? I don't have
>one, but I seem to remember the guy who sold this TT to me saying something
>about he used to have a video card in it,
>

Slight confusion. The connectors for Serial 1 and Serial 2 on the
TT are on a litle backplane that covers the VME slot. The ports are
connected to the motherboard of the TT via some flat ribbon cables. Many
people when they installed graphics cards removed the VME back plate and
put it aside as the space it needed to occupy was now blocked by the
Graphics card in the VME slot.

In this circumstands the ports still exist as far as the OS is
concerned, but you have no physical connections to plug anything into.
On my machine I have a NOVA card which has plenty of space below it to
dangle the flat ribbon cables out and I plug my modem int them. Probably
not "pretty" to some people, but what do you really care as long as it
works. Some people unfortunately have very short cables so that there is
not enough length to them to dangle them out of the back of the machine.
For these people I recommend getting a PC serial port back plate
connector. They don't cost that much and would give the machine back
Serial 2 which is the only real RS232 port on the TT (it's the fastest).

However since you want to use the LAN port you will be disabling the
Serial 2 port on the back of the machine anyway. In effect they are one
in the same port, it just has 2 connectors. Whatever software you use has
to enable the LAN port instead of the Serial2 port, which is the default
setting.

>the "slogan of the week" for that week.
>
>(Atari changed slogans about as often as the Tramiels changed their
>underwear - witness how soon these "Commandments" were forgotten).

HEh ... this is slightly off-topic, but it's like a commercial I have
in my collection. The transcript goes like this:

"The Chairman of Atari has a motto he'd like us to follow. (Cue huge
"Business is War" logo highlighted by rotating floodlights) So Atari
is going to show you that despite its image, IBM charges too much for
the memory it gives you. That Apple Macintosh Plus costs far too much
for the memory IT gives you. Atari won't do that to be malicious, but
to demonstrate the Atari ST is nothing less than the best value in
personal computers. Who's going to win the computer war? Stay
tuned..."

Kind of ironic...

1783. Atari question

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 12:45:29 UTC
From: Sinister <NoSpAm!@DoUgIvEhEaD.CoM>
Message-ID: <Jfxf6.1153$tT3.10420@news-server.bigpond.net.au>
Source record: 50719

When they designed the atari ST, why didn't they just put a SCSI port on it
so as to allow many other devices to be connected aswell or instead of a HD,
Was it cheaper to put those little proprietary hard drive connectors and use
MFM drives ?

1784. Quadra 950, MagicMac, NVDI question

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 13:02:12 UTC
From: Derryck Croker <derryck@NOSPAMcix.co.uk>
Message-ID: <981376730-16277AEicMi@cwcom.net>
Source record: 50723

Hi all,

Have a chance to buy a Mac Quadra 950, so I'd like to use it as a replacement for my Falcon - faster speed and higher resolution graphics are what I crave. 1024*768 by 16.7 million colours, great!

So, with MagicMac and NVDI installed, what sort of performance increase could I expect over my Falcon CT2 (ballpark figures), and will NVDI know about the "supa 1024*786 million colours graphics card" (sic) which this machine boasts? I'd hope it would be transparent, but maybe not as powerful as the MagiCPC version of NVDI, the direct entry of res/colour depth that one wants. What colour depths/resolutions does NVDI offer under such a setup?

ITMT I'm seeking a better description of that card (how many million colours is that?), but is there anything I should beware of? Printer, modem etc compatibility?

TIA.

There is a simple answer for that question. SCSI was not
standardized until after the ST's design. After it was standardized they
started putting it on some machines (TT & Falcon), but there was already
an installed base with the ASCI port, so they felt they needed to continue
to support it. The TT has both ASCI and SCSI. There was quite a bit of
complaint when the Falcon came out that it didn't have an ACSI port, since
that meant people could not directly plug their atari laser printer into
the Falcon.

No. It's fine for text, but try doubleclicking any other type of file for
which you haven't specified a particular viewer!

A system-wide viewer should cope with anything, 1stGuide copes pretty well
but (as we've said) can't cope with printing text. It prints images just
fine though.

>from NVDI on top of the NOVA VDI.

According to the benchmark tests we can expect to see a slow-down in
graphics output when coupled with NVDI though. I know that one can use
Speedo instead, but that's quite antedeluvian now and doesn't support the
printers which NVDI does.

An Atari version of Papyrus should be capable of reading colour GEM files
from other Atari programs, otherwise there is absolutely no point in
including it!!!

I'm still arguing with my sequencer, but in the spirit of filling the
world with dreadful sounds, I recorded a bit of what I do when I'm just
bouncing ideas around (i.e, the point at which I realise I need six arms
to control all my synths at one).

http://www.mp3.com/RealTyme

Could this be the worst attempt at music on mp3.com?
I don't even think it qualifies as an attempt, myself ;)

Anyway, expect more dross under the pretence of 'actual live recording'
as soon as I've had some extra limbs grafted on (or sussed out how to
use the SH-101's bassline programmer to better effect).

Now tell me I don't need to get my head around recording ;)

Richard

1795. Simms for STE

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 15:49:24 UTC
From: Tim Pattison <tim@ravenhouse.demon.co.uk>
Message-ID: <V0jIjCAEusf6Ewoo@ravenhouse.demon.co.uk>
Source record: 50730
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,alt.atari

I want to upgrade my STE from 520k to 4 mb and I have access to some 1mb simms from an old PC but need advice as to whether the simms need to be parity or non-parity and whether they should be of a particular speed.

I have 7 1mb simms in total but they are not all the same.

There are 4 identical ones which contain three chips on each simm (I presume this means they have parity) and the speed would appear to be 70ns.

One has 9 chips (parity?) and would appear to be 60 ns

One has 9 chips and would appear to be 80 ns

The other has 9 chips and would appear to be 100ns

Are any of these suitable for an STE?

Can't comment on the rest, but unless the Quadra has a NuBus card, you're going to have to hope it has the VRAM upgrade simm in place to get 24bit - the Quadra series will ONLY do 256 color without the upgrade or a seperate NuBus card. I'm not even sure that the Quadra can do 24bit at 1024x768 *with* the upgrade simm, so you might need to use a NuBus card anyway. Actually, checking, the Quadra can only do 16bit color with the onboard video AND the upgraded VRAM, you will NEED a NuBus card to do 24bit at all...

All around, the 900/950 series are about the top of the line 68k mac (i have a 900 upgraded to 950 level), very easy to expand (if you have a lot of 30pin SIMMs hanging around - they have 16 SIMM sockets for 4 banks :).

I have been giving this some thought for some time, there area number of ides,

The PC runs an Emulator such as Pacifist that has been re-compiled to access the PC hardware directly via BIOS rather than DOS calls. This would not be that hard to do but you would only end up with a fast ST and it would still not be that quick as the constant emulation of TOS would really bring it down. The inability to compile native 8086 code also means that this is in essence an Emulator running on a PC still (a 'Virtual ST' if you like as all hardware is emulated).

I think the one that comes closest to a clone would need to have TOS in ROM (to keep people happy) but this is hard work as I am sure VIA or someone would not want to help you with how their ROM chip works and how to access/change devices attached to the board. So we need to use keep the BIOS of the PC and then get TOS to run from disk, to do this TOS would need to be in 80x86 code and NOT 680x0 so a re-compile into 80x86 of TOS is required.

The XBIOS in TOS would need to talk directly to the PC BIOS (probably not to hard) and then all other functions 'should' run OK on top, but this only gives us TOS and not one program will run (although we could copy files around disks). To run programs an emulator is also required which could be hard work to implement into TOS as it was never designed to be like this.

I've ran my Quadra 950 with MagiC. Pretty decent setup, faster than an AB Falcon for the most part. I didn't have an fx card, just the upgraded video memory. Pretty sure all I could get was 800*600 16bit color. At any rate, sure beats running the Mac O/S on one. Serial is RS 422, AIRC. I had problems with hardware handshake (no matter what cable I used). Connecting AHDI compatible hard disks is a breeze. You may need to look into something called "Power Print" for printing compatibility.

Dennis (et.al.) ,

Thanks for the information, which raises a further question in my
mind...

I have an iMac with MacOS 9.0.4. From other reading in this group, I
understand that no version of MagiCMac runs on MacOS 9.1 yet. Are the
patches on the ASH site usable with the most recent English translation
of the MagiCMac? or only with the German version?

Thanks again for any help on this.

1803. Usage and News and lack there of...

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 19:27:17 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a7efe95$1_1@athena.netset.com>
Source record: 50737

This is just a small personal rant, but I'm sure other people will agree or disagree with me to some extant.

As we have seen in the last couple of weeks with various debates in this news group there are quite a few people that still frequent it. However I notice there is a distinct lack of conversation about current projects for our beloved platform. Sure we get quite a few "Can you help me with this?" or "Is there any software that does ...". But rarely do we see real discussion based on things that are actually still be developed outside of some simple arguments based on peoples personal preferences of OS (and excepting of course the current arguements over ColdFire no ColdFire).

I'm sure this would make many despair and think that there was nothing being developed currently. That the whole platform was in fact dead.

Now you might say, but we have news sites... www.magical-sides.de, www.atari-home.de, www.atari-users.net, kawecki.atari.org, atari.org ... the list goes on. Yes there are alot of good news web sites to a certain extant, but they only go so far. Atos does a very good job of getting reviews for software and is a great site if you can read german. But most generalize in head line news. This is a great service they provide, but somewhat limited.

I give atariuptodate.de, major credits for the work that goes on there, it is nice to be able to check for the current versions of some of the applications I use.

We also have UTSI which provides a resource for finding a wide range of apps that might fit a specific task.

However I charge that this is not enough!

There are alot of things going on that never make it to any of these sites. Or if they do the language barriers stop many potential users from trying it. This is not good. I can assure you that programmers don't like to work on software that they don't think anyone cares about. Registrations and donations, while welcome, rarely give these programmers any sort of income. So that's not why they do it.

Here are some things I've not seen yet.

An english discussion on the Bubbles Screen saver.

A modern version of Jo Dipching's GEM games list. (this one is sorely missing in todays atari world)

What's the state of X86 Tos projects?

Did you know there is such a thing as Debian MiNT? How's it work?
Where is it going?

Where did Mac MiNT go? Someone was working on it in the last
couple of years.

I'm fairly sure that most of us, would be interested in knowing
some more on one of those topics. There are certain topics we hear alot
about but others that might as well not exist for all the news we hear.
So it feeds back into the programmer. They release something, no one
seems to care, they don't worry about updating it unless there is
something they personally need.

I also don't want to harass the people that do write reviews etc
of programs. We have a few people out there putting in alot of
volunteer hours. However it's just that a FEW people.

Now I started off this litle rant by pointing out that there is
traffic in this group when people feel so motivated. So motivate
yourselves! If you have some info share it with people. I'm just like
the rest of the atari user base, when I don't see anything going on I get
depressed. If you have information pass it on. There are alot of mailing
lists out there that people belong to and often I imagine, the people on
that list think that everyone that is interested is on the list. Not
necessarily so. I know there has been alot of stuff going on in the MiNT
world these days, however if you aren't on the mint lists you get very
litle of this news. While I don't regularly use MiNT I am interested in
whats going on as I am sure others are. I'm just not all that interested
in being on yet another regular mailing list. I just use that as an
example, not a specific criticism.

If you are relying on the programmers to give you all this
information then you are giving up. Some people would rather spend their
time coding then writing large doc files, let alone making large and
comprehensive disertations upon the use of the software.

I also want to point out lastly one major misconception in the
world today. There is an idiot who wrote an idiots guide, who said if you
don't want SPAM then don't post to newsgroups. I'm sure there are some
people that don't post because of this. This is an outdate fear. If you
are concerned then you can modify your email address so it makes it harder
for people to skim it out of the news feed. However let me supply this
small amount of information. There is one account that I use for mail and
email and web space and another account (different ISP) that I use for
connection. The one that I do no mail or news on regularly gets just as
much SPAM into it's box as the one that I post to this group with. Let me
repeat that. An email account that has been supplied to no one gets just
as much spam as one that appears here in proliferation when I'm in a news
reading frenzy.

This isn't a call for noise. Just a call for activity from the
users. Then maybe I'm wrong and there aren't any anymore.

1804. Problems with CDROM, STING, HSModem, CAB, Crazy Dots card, serail connection to PC

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 19:30:45 UTC
From: Mark <mark@recycledsteel.co.uk>
Message-ID: <981372734.24707.0.nnrp-10.9e98a620@news.demon.co.uk>
Source record: 50717

As some of you may or may not know I have been having problems with a number of programs, you will be glade to know that I have sorted out a number of them and I just want to say "thank you" to everyone that helped.

CDROM
All files looked OK with names, etc and would even copy but would end up on the hard disk corrupted.
Turns out that one of the pins on the cable (50 pin job) was a bit bent and had actually pieced through the socket on the back of the CDROM and messing things up. I little bit of bending and then using port 2 on the CDROM solved the problems.

STING and HSModem
This was connecting but only PING would work (and then it would drop lots of packets).
Changed the order a bit in my AUTO folder and also put MFP_TT as well as SCC in there and it seems to work (I also put a 'sockets' program in there which Telnet said I need, don't know what it does). I still think this is so hard to use, I will even write an interface if I could get hold of the 'setter' source (need a project). As for the serial/modem port thing I don't know the difference and have never seen a serial port on my TT (I have a graphics card). I can't talk to the modem if I use speeds over 34XXX (or whatever it is) using Modem 2 (modem 1 doe snot appear to work at all well), is this HSModem or my Modem?

CAB
No one mentioned the need for CAB.OVL, for some reason my original install of CAB did not have the 'home' page set with the instructions. I thought this was just an English translation file. I am getting about 4K/sec using Modem 2 and a Motorola 28.8 3400 modem, if I get a 56.6 modem and bugger the serial port through the case will this become quicker?

Crazy Dots
Getting NVDI 5, the NVDI 4 I have is the normal version and does not contain the ET4000 drivers. The programs I have are VMG4000 and use files such as CD1_XXXX and CD2_XXXX, a creation program of sorts and a NVDI conversion program.

Serial Connection to PC
Have not tried to get the PC connected since the CDROM drive now works.

I've installed the "Mintnet for Dummies" package (correctly, I think).
I updated the pppchat.to script so I can log on to my ISP with user
name and password, and put myself into ppp mode. When I run pppd from
the bash shell, I get the message "Serial connection established", but
nothing else, and the connection times out. ppp0 shows an MTU and MRU,
but is "closed". The pppd process is in "sleep" mode. I can access
the ISP fine on other Ataris using Sting (Sting bombs while loading on
the Milan). Any ideas on what to try?

1807. SIMMs for STE

Newsgroup: comp.sys.atari.st
Date: 2001-02-05 20:51:30 UTC

Source record: 50676

FamilyNet Newsgate

Hello Tim!

TP> I want to upgrade my STE from 520k...

Probably 512Kb, not that it really matters ;-)

TP> There are 4 identical ones which contain three chips
> on each simm (I presume this means they have parity)
> and the speed would appear to be 70ns.

Those almost certainly have parity. I suspect the STE does not use parity, in which case the extra bit should simply be ignored. 9 chip SIMMS are slightly different from 3 chip ones in terms of timing. I imagine 70nS SIMMs should be fast enough for an STE, hopefully someone here has used two (or three) chip SIMMs in one and will be of more use to you than I am.

TP> One has 9 chips (parity?) and would appear to be 60 ns
> One has 9 chips and would appear to be 80 ns
> The other has 9 chips and would appear to be 100ns

You may find it harder to find a use for the odd ones, especially since they're different speeds. I hope the matched four work for you. There should be no harm in trying them in your STE. Good luck, and be sure to let us know how you get on.

Regards,
- Andy.

FamilyNet Newsgate

Hello Mark!

M> The PC runs an Emulator such as Pacifist that has been
> re-compiled to access the PC hardware directly via BIOS
> rather than DOS calls. ^^^^^^^^^^^^^^^^

That's pretty much a contradiction. When we're talking about DOS programs,
they generally access hardware one of three ways...

1) Through DOS - mostly the filesystem, memory and
perhaps a simple text console.

2) Through BIOS - DOS itself works through BIOS, it's also
used by some software for text console
and other miscellanious jobs.

3) Directly - This used to be done a lot for graphics
work, especially games.

...depending on the software, a combination of those three
approaches might be taken. A fourth option which I haven't listed is through
device drivers, where the device driver itself often talks directly to the
hardware.

M> This would not be that hard to do but you would only
> end up with a fast ST and it would still not be that
> quick as the constant emulation of TOS would really
> bring it down.

Agreed, I don't if any significant speed increase would result from bypassing
DOS. I would be interested in knowing more about how current 'ST on DOS'
emulators work - whether they just emulate the hardware, or hook into GEMDOS,
VDI or the ST BIOS to intercept and redirect calls to the PC side of things.

M> The inability to compile native 8086 code also means
> that this is in essence an Emulator running on a PC
> still (a 'Virtual ST' if you like as all hardware is
> emulated).

I was reading with interest last night about the on-going development of GEM on
the PC since its release under the GNU Public License. I'm not all that
familiar with GEM development, but depending on the application, it might speed
things up a bit if the AES and VDI layers were native even if the 'guts' of the
program were emulated (based on the possibly incorrect assumption that some GEM
programs spend much of their time doing user interface stuff).

M> I think the one that comes closest to a clone would
> need to have TOS in ROM (to keep people happy) but
> this is hard work as I am sure VIA or someone would
> not want to help you with how their ROM chip works
> and how to access/change devices attached to the
> board.

Hopefully it would be in Flash ROM, so that we could upgrade it easily :-) I don't think it really matters if we're loading TOS from disk, I believe that's how the original STs did it. I have a PC with a VIA chipset and AMI firmware. I'm guessing the chipset is fairly well documented, since NetBSD seems to know enough to recognise its features and drive them appropriately. I don't think we need to be pulling ROM chips of motherboards, we could just do what the BSD/Linux people do: use the existing ROM boot-strap to load TOS (or the underlying emulator) and then ignore the PC BIOS (which is mostly real-mode anyway).

M> So we need to use keep the BIOS of the PC and then get
> TOS to run from disk, to do this TOS would need to be
> in 80x86 code and NOT 680x0 so a re-compile into 80x86
> of TOS is required.

I wonder what TOS is written in, possibly various things. I have no idea how practical it would be to port it to x86. I guess bits of it could be re-written to speed things up, hopefully in a way that wouldn't tie it to x86 though.

M> The XBIOS in TOS would need to talk directly to the PC
> BIOS (probably not to hard)...

The problem that springs to mind is that the PC BIOS is real mode and so limited to 1Mb (of which only 640Kb is usually available RAM). I imagine a protected-mode implementation would be faster, not to mention more roomy.

M> ...this only gives us TOS and not one program will
> run...

Good point. Some software could presumably be cross- compiled, some would have to run under an emulator* and sadly some just plain wouldn't run at all.

M> To run programs an emulator is also required which
> could be hard work to implement into TOS as it was
> never designed to be like this.

I think it makes sense to think of TOS and the emulator as separate lumps. If progressively more of TOS were re-written or re-compiled to run native on the new host system the boundry would be blurred though. Come to think of it, I've never written an emulator (of a computer) in my life so I ought to be quiet and make room for the experts to explain how it works in the real world! :-)

Regards, *Unless you have an '040 or
- Andy. something on a PCI card.

Hello Mark!

M> I am getting about 4K/sec using Modem 2 and a Motorola
> 28.8 3400 modem, if I get a 56.6 modem and bugger the
> serial port through the case will this become quicker?

If that's 4K *bytes* per second, then you're doing fine, I wouldn't worry about a V90 modem. I'm not sure what other people here think, but 57.6K bits per second sounds like a sensible speed to set your serial port at when running a V34 (28.8K or 33.6K bits per second) modem with MNP4 or V42 error correction and possibly V42bis data compression. I would avoid MNP5 compression if you're using it to browse the web. See your modem manual for details.

Message-ID: <3a7f2728.6033866@news.cwru.edu>
Source record: 50743

Hey everyone! Just recently MagicSLM was suggested to me for use in printing documents from my PC to my SLM804 printer. I'm currently running Windows 98 on the PC and it's connected via null modem to the Atari at 9600 baud with both systems using XON/XOFF. Now MagicSLM seems to be running fine, but my documents don't print quite right.

MagicSLM doesn't seem to translate everything quite right. Right now it appears to be screwing up the margins on the printer. The top margin is improperly alligned. And some graphics seem to print incorrectly. Any thoughts?

The PC is using an HP LaserJet Plus driver printing directly to COM1:. The normal LaserJet doesn't work quite right. Anybody have this working, and if so, what exactly is your setup? Just wondering! Thanks!!!

Chris Crosskeys of ASP used to advertise those threaded inserts, however you could most likely get them from Maplin or RS Components.

>powery residue of plastic when I opened it to try a 3Gb drive (didn't

If you took a razor saw and cut down the length of the pillar a little, you could then try pinching the split up a little to narrow the hole a bit.

>work. *sighs* I'm figuring that if HHDriver isn't seeing an IDE device,
>it's dead).

That's a shame :-(

Was it a notebook drive? I've just bought a 12Gig one from Computer Exchange. That's for use elsewhere, but the 4Gig one that will be liberated as a result will find a home in my Falcon (thus leaving a 2Gig one spare).

Yes, the 9 chip is 8+parity and the 3 chip is 2+parity, best to try and use
identical chip's, parity is not used by the ST at all, so don't worry about
it.

As for myself, I've been interested in getting CDWriter working (backup and ISO9660 work, but I can't seem to cut a music CD), playing with Aniplayer (a wonderful program ... and yes, I'm registered) and getting a 44.1 clock for D2D recording (any ideas)? I also ordered ScanX Pro to replace ScanX and I'm trying to find a copy of MagicMac 6 so my little Powerbook 180 can replace the Stacy I gave away (now, that was stupid of me) a couple of years ago.

I do get your point, though. We generally deal more with helping each other with problems than discussing programs. So start a couple of threads!

Systems for Tomorrow and Chromagic do not have MagicMac as of last
week. Systems for Tomorrow said that he would check into availability,
but hasn't responded to my last email a week ago (yet).

I'm seriously considering ordering the French version from Europe
Shareware in France. I don't speak French, but the price is good and
they claim to have it in stock. I'm not 100% certain if an
English .RSC can be obtained though.

FamilyNet Newsgate

Hello Derryck!

DC> ITMT I'm seeking a better description of that card
> (how many million colours is that?)...

I've read one report that the Quadra 950 doesn't handle 16- bit colour. That flies in the face of what other people have written here, so I'm guessing that it was based the experience of someone with a large monitor who didn't have the optional video RAM upgrade. The following table is based entirely upon supposition, your mileage may vary...

```
Pixels 1Mb 2Mb 8 = 256 colours or greys
~~~~~~~~~~ ~~~ ~~~ 16 = thousands of colours
1152 x 870 8 16 24 = millions of colours
1024 x 768 8 16
640 x 870 8 8 <- Mono portrait?
832 x 624 16 24
640 x 480 24 24
512 x 384 24 24
```

..hopefully this group's Quadra 950 owners will be able to verify or correct this blatant guesswork.

Reading further, Mike says he's done '800*600 16bit color' with the VRAM upgrade. Suzanne says 24 bit isn't possible with the on-board video, and 16 bit is only possible with the VRAM upgrade. I guess that would make the options look like...

```
Pixels 1Mb 2Mb 8 = 256 colours or greys
~~~~~~~~~~ ~~~ ~~~ 16 = thousands of colours
1152 x 870 8 16 24 = millions of colours
1024 x 768 8 16
640 x 870 8 8 <- Mono portrait?
832 x 624 8 16
640 x 480 8 16
512 x 384 8 16
```

...which is more modest, but still better than a poke in the eye with a sharp stick. Further corrections are invited.

(hopefully the BBS <-> newsgroup gateway won't mangle the tables in this message)

Regards,
- Andy.

....

Hi Martin!

Thanks for info. May I ask an elementary question? I know that the
'rwx...' sequence refers to access rights under MiNT and possibly the
Mac, but what is the meaning of '1 root' and 'wheel'? Actually I don't
really understand the access rights either - I know what they mean
literally, but why, what are they good for, how are they used?
Presumably only useful on networked systems when more than one user has
access?

Perhaps there is a published FAQ or article someone can tell me about
(and where to find it)?

Many thanks!

Regards, /Peter/

That's what I thought. Perhaps it just doesn't like MagiC, or
recognise the Falcon's IDE boot drive? As I said before, running
HDUTIL.PRG brings up 'ICD Host Adapter or ICDBOOT required' and
running ICDBOOT.PRG comes up with 'ICD Hard Disk PRO Driver V6.2.0
Copyright (c) 1993 ICD Inc.' at the top of the screen OK, but then it
hangs with 'ID 15 ** UNRECOGNIZED UNIT**' and I have to reboot to get
out of this.

That would be my guess also. It cost money to add the SCSI port. Actually
they should have introduced something like the STe first. If they had, then
there would have been alot more Atarians.

Aside from speed, the lack of Javascript and not being able to make
secure transactions does'nt help stem the migration! I fear that any
new Atari clone will fail without that support! :(

Actually SCSI was a standard when the ST was designed. It was still
very expensive, but it was available.

ASCI is a "subset" of SCSI- almost SCSI, cheaper to implement than a
full SCSI interface would have been, which is the reason Atari used
it.

Hard drives were still quite expensive, and it didn't make sense to
install an expensive full-SCSI interface when a lot of people would
probably never make use of it. If you wanted a hard drive, you just
had to buy the interface then, instead of when you bought the computer
originally.

Only some of the early Atari hard drives used MFM mechanisms. Many
used a SCSI host adapter interface to the ASCI port, which allowed ANY
standard SCSI device to be connected, including standard SCSI hard
drives. There just weren't very many other kinds of SCSI devices
(other than hard drives) at the time.

Message-ID: <90fu7t02p9thvtlkqs82ji6nugur083429@4ax.com>
Source record: 50655
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,alt.atari

Just about ANY 30 pin, 1 Mb SIMM will work for the STe.

Parity doesn't matter- The STe doesn't use parity, if the SIMM has the
extra parity bit, the STe will just ignore it.

Speed also doesn't matter. any of those SIMMs listed are far faster
than the STe needs (`150ns is the spec for an ST), so any of them
will work.

It's NOT however, a good idea to mix types, styles and speeds.

I would go with the set of 4 identical types.

My favorite is one Atari actually DID use, and broadcast on TV-

(Little aside here... why in the world would a company actually spend
the money on creating, producing and filming commercials, and then
toss the film cans in the back of a closet and never use them..?)

The camera starts on the left, on a full screen shot of an Apple
system, and the announcer (without identifying the computer by name,
of course) tells us how great it is at creating wonderful graphics,
then the camera pans to the right, across an Atari ST system, to an
IBM system on the far right.

The announcer tells us how great this system is at business
applications. Then the camera pans left again, past the Atari ST,
back to the Apple, where the announcer tells us how wonderful the
system is for producing music.

Then again it pans to the right, past the ST back to the IBM, where
we're told how great this computer is for.. blah, blah, blah.

Then another voice yells, "Hey wait a minute- what about the one in
the middle?"

And the announcer says, (as the camera finally comes to rest on the
ST), , "Oh, that's the Atari ST. It does all the things these others
do, but it only costs half as much."

I really DID see this one on TV... once.

>
>Kind of ironic...

Indeed..!

Yep. It's amazing how many SCSI problems deal with cabling or
termination.

Sockets is used by IConnect. You shouldn't need it at all with STing.

This depends on where you live. In the L.A. area, my Falcon routinely
clears 5K/sec (and my Falcon port is, for some reason, maxed out at
57600 bps -- it's supposed to go to 4 times that). If you are in the
country with lots of copper wire between you and the ISP, you may well
not go any faster. How much background noise is on your phone line?

Although Uwe posted earlier, it might be useful to review:

TOS 1 -- 256MB per partition
TOS 3 -- 512MB per partition
TOS 4 -- 1 GB per partition

I'm not certain about TOS 2

1834. Possibly FS: Atari Falcon

Newsgroup: comp.sys.atari.st
Date: 2001-02-06 00:43:04 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <qLE80mJYi0f6Ewtu@lovecraft.demon.co.uk>
Source record: 50661

I'm trying to do too much with it, I think, and I've reached the sad conclusion, with all the conflicting advice and lack of ready availability of things like extended MIDI ports that work, that life would be much easier as a musician if I just went the PC route after all.

This isn't an easy choice to make, and I'd love to run both together but I simply can't afford it. Some people have been extremely helpful, in fact, most people have been extremely helpful right up to the point where /I/ got confused and stressed about the lack of solid information, but nothing can compare to just picking up a magazine, opening a page and seeing exactly the device I need at a sensible price.

So my Atari is for sale:
Atari Falcon 030 with 215Mb internal, FPU, 14Mb RAM, drive tower with 1Gb, 540Mb, Syquest and CD drives, VGA monitor of some sort, lots and lots of software, optical mouse, original unused mouse, Jaguar joypad. I'm open to sensible offers, obviously if I don't get enough I might as well keep it, but I plan on getting a 128 Channel MIDI interface for my PC and Cakewalk, to give you a rough idea of the figures.

A lower-end ST machine would be acceptable as p/x, either a MegaSTE or MegaST (must be separate keyboard model, as it would be incorporated into a rack).

If Chris gets back to me, it should have the inserts in the case for the screws.

Richard

This is often a sign of cabling or termination errors. In fact, I got
it last week on my Falcon. After a hasty powerdown and checking the
connections, it went away (whew!)

The problem is finding inserts. I, in the US, went to a metric screw shop,
and found none. I have not tried going to a plastic supply shop. What you
need is knurled brass plastic inserts for 3 mm screws, and a hot soldering
iron tip to push them in.

Step closer than me. I haven't downloaded it yet I've thought
about it, but haven't done it. Would like to get someone elses impression
of it. You know the things we used to have magazines to cover. Works
good everywhere/Magic/MiNT... No conflicts/lots of conflicts. Info like
that. I like having cool new software for my system, but am nervous about
installing new things without someones review before hand after a few bad
experiences in the past. There is not much like the pain of discovering a
large number of hours of work have just been corrupted.

>> sorely missing in todays atari world)
>Magicos.de had one. Basically, if it runs under Magic, it'll run under
>anything. The contest they had last year added several good games.
>

Magicos.de had a selection of programs that ran with Magic. It
was far from complete. Nice that it's is/was there (not certain if that
section is back up yet), however it's only a thin portion of the games
that are available that will run under GEM (by this I mean anymore the
class of games that will run without stealing your whole system or at
least give you a chance to switch back/ run properly under a multitasking
setup/ not limited to ancient hardware specs /probably a few other things
as well). We are discussing as a community where we want to be in a few
years (if anywhere). These games are the most likely to directly transfer
to anything that is running GEM and has at least 68k emulation.

Here is Jo's URL take a look at it and see how I'm discussing the
fact that magic online only has a portion of the games.

http://ping4.ping.be/dipching-drulkhor/VGA-GAME.HTM

There have been a few things added in recent years, but there
isn't everything on that list. There are even older games that aren't on
his list. But it's probably about the best we have so far for a quick
list.

It would be nice if one of the PHP gurus around here would set up
a system where people could submit programs and give ratings of what they
thought about it. Really be cool if it was cross linked to atariuptodate

so that you could verify the most recent version.

>> What's the state of X86 Tos projects?

Click on the link in MyMail and send to clipboard. Click on the CAB
window, and select URL. A press of the ESC key will clear the line and
Control-V will paste the URL in from the clipboard.

> ...as well as create web pages in Everest and have them appear in
> Cab via OLGA.

I'm not entirely sure how OLGA works. I haven't managed to install it
myself. As a workaround, save the everest file and click the new icon.

So as a matter of info. How does the MP3 playback work with
clones etc? On my TT it's just enough to be tantalizing, but not enough
to be satisfying.

I believe Zyxel made a couple of modems that did support the
strange atari rates. At least a TT user was assuring me of this fact
several years ago.

If you are still in the modem market and have a TT I can highly
recommend the Supra Express external 56k. It goes all the way up to 230k
DTE rate and with the death of modems they can often be found a bargain
basement prices. When I purchased my first one a couple of years ago it
was well over $120 US, we got a second one for another machine in december
for under $70 US.

SNIP

Just a word of warning Richard, the PC avenue is fraut with danger as well, I would agree there is alot of conflicting advice out there, but in my experience (and I fix/sell PC's for a living), most PC sales and repair guy's don't know there arse from there elbow. I get so many PC's in the shop to fix that have been butchered by inexperienced fool's, you wouldn't believe it. While the Atari can be confusing to the novice it is very hard to kill.My setup is not to dissimilar to your's, except I use a CT2 as well, and it isn't rock solid, but it is a damn site more stable than mos name brand PC's. Sorry to see you give up on it, anyway

Once upon a time <F2Jf6.1695$tT3.14942@news-server.bigpond.net.au>, Mark
Bedingfield <mark@baypc.com.au> grabbed chalk and scrawled:
>Just a word of warning Richard, the PC avenue is fraut with danger as well,
>I would agree there is alot of conflicting advice out there, but in my
>experience (and I fix/sell PC's for a living), most PC sales and repair
>guy's don't know there arse from there elbow.

I know. I know PCs backwards, and used to use a PC for MIDI. At the
time, I found most of my problems then were due to Cubase VST - I had no
problems with the hardware. I'm very wary of USB MIDI interfaces,
though.

4 years ago, I built my own 200MHz MMX PC for audio and video work.

128Mb RAM, Diamond 8Mb graphics, Diamond Video Crunch-It! card, Adaptec
SCSI with fast 7200RPM IBM Ultrastar 2XP, Creative AWE 64 Gold with 8Mb
Soundfont RAM, ethernet, internal modem of some sort, removable SCSI
drives for different OS setups. It never flaked out on me. I tend to
have to repair people's machines because the local dealers can't build
them (I've acquired a 64Mb Radeon card because one dealer couldn't get
it right).

>I get so many PC's in the shop
>to fix that have been butchered by inexperienced fool's, you wouldn't
>believe it.

Thankfully, my Dell hasn't been butchered ;)

The Atari hardware isn't limited for the task, the interfaces are
expensive sadly, but I've never had to do anything like the messing
around to get applications to work.

The idea of having to choose between my sequencer working, or my file
manager being half useful (even if the error messages it spews are in
German), seems just weird.

Cubase crashed my Falcon. I'm not surprised, I probably have it in the
wrong directory and have to edit some files, or something.

Dan,

I agree.. a lack of usage.. I'd love to see other people post news, info, reviews.. oh yes.. Reviews would br GREAT..heck anything related Atari on Atari-users.net (here too!). That's the reason why I have the site. But it's hard when nobody post anything (BTW.. THANKS for all your post Dan!! I do appreciate them!!).

If I had the time (and Skill!!!) I would write some reviews.. but do any of us have free time?

For another site for Atari news.. A-ONE (Atari Online News, Etc.) Magazine www.AtariNEWS.org Same deal.. feel free to post any news and info you have that is Atari related.

Both sites use a php "portal" system called phpnuke(.org). It has a built in system that will allow other sites to display our headlines. IF anyone knows how to use the feeds.. please feel free to (unlike Atari.org!). Don't ask me how to use it.. I haven't dug into it... YET! If anyone does know.. fill me in!!

My answer for starting a thread.. "Anyone use Mario's Galaxy video card???"

1855. I want to "rent" these ST programming books

Newsgroup: comp.sys.atari.st
Date: 2001-02-06 08:25:21 UTC
From: dang@elp.rr.com.nospam
Message-ID: <Xns90401C6AC5D0dangelprrcom@207.250.5.3>
Source record: 50692
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

I would be very interested in these 3 books (I understand they are [the only?] 3 volumes of a set). They have been out of print forever, and I have had no luck in searching for them in the used book arena. I would really rather do this as a set, as it would save me on shipping costs.

Compute's Technical Reference Guide - Atari ST, Vol 1: The VDI
" " Vol 2: GEM/AES
" " Vol 3: TOS

Now what I'd like to do is this: I will pay shipping both ways, as well as a reasonable fee for your trouble (say, 5-10 dollars for the set, less individually). These books are long out of print and I want the information contained in them, for a little ST programming site I am doing. I will ship them back to you after a week. Obviously there's quite a bit of trust required for this, and I will give you plenty of personal information accordingly. Again, I'd prefer to do this "rental" as a set, but please mail me anyhow if you only have 1 or 2 of them, because I may in the end resort to renting them individually.

Thanks,
-dan

>And the announcer says, (as the camera finally comes to rest on the
>ST), , "Oh, that's the Atari ST. It does all the things these others
>do, but it only costs half as much."
>
>I really DID see this one on TV... once.

I only ever saw one, and it was a part of the short-lived "Atari
Shatters the Myth" campaign. I saw it twice on one of the major
networks, and then never again. Rather a pity tho, 'cos it's one of
the ST commercials I _don't_ have.

I do have a few comparing the IBM and Apple, however, including one
regarding the other people's "Expensive Attachments" (their name tags)
and a couple specifically comparing the Atari ST to the Apple Mac.

My favourite and probably most ironic one though, is this little
ditty:

(Cue picture of expensive laser printer) "The LaserWriter NT from Apple -- a good marketing company. So good, this 8 page per minute postscript laser printer with only 35 fonts sells for about $5,000." (cue $4,999 price tag below) (Cue another expensive laser printer) "Here's the Personal Page Printer from IBM, another great marketing company. They're giving about $5,000 for a postscript laser printer that prints only 6 pages per minute with 43 fonts." (Cue price tag again) (Cue Atari laser printer) "And here's Atari, with an 8 page per minute postscript-compatible laser printer with 50 fonts. but Atari gives you more." (Cue long shot of laser printer with additional components appearing during narration) "A 4 Megabyte computer" (cue Atari Mega ST4) "30 megabyte hard disk" (cue Megafile 30 atop Mega ST) "and the desktop publishing software" (cue mono monitor displaying, I think, Calamus SL) "all for less than $4,000." (cue $3,999 price tag) "Imagine that. An entire desktop publishing system for less than what the others charge for just the laser printer alone. Hmmm ... what a terrible marketing company Atari must be. Or are they?"

The Tramiels? Good at marketing? Now that's rich. :-)

>
>>
>>Kind of ironic...

> >Artworx is to blame?

Yes. Artworx didn't follow the standards set by the first - and well
known, in this good old times - program being able to create
coloured GEM graphics - Xact.

So what we did in Papyrus is that we implemented coloured GEM
graphics, done by Xact.
>
> It depends if 'coloured GEM formats' were specified in the original

>
> I have to admit ignorance as to what the GEM standards specify.

They - Atari - said "follow the GEM Artline 2 format" - what Xact did,
as the first program, and what we did, following them.
>
> >So Calamus, Photoline, TMS vector, Cranach studio... etc interprete the

Wrong. We DO interprete coloured GEM correctly - if coming from Xact.

Yep. But. :-)

But we will go into contact with Christian Witt / Artworx, so maybe
we can find a solution together, late spring.

Beginning with the first program having been able to do coloured GEM -
Xact (former known as Scigraph, in the very old good old times, last
millenium ;-)).

> It seems that all the other programs mentioned here adhere to another

Ah maybe I didn't clear that point enough when we both talked - I don't
think
it will be CWG but a more compatible GEM thing.
Christian Witt told me that we - he or us - can make compatible changes
easily, but we have to find the time to do that - let's say late spring.

1861. Re: Papyrus and GEM metafiles

Newsgroup: comp.sys.atari.st
Date: 2001-02-06 10:30:34 UTC
From: Ulli Ramps <Ulli@rom-logicware.com>
Message-ID: <3A7FD24A.B8CDA54A@rom-logicware.com>
Source record: 50499

Hm hm hm. A "bug" in VDI? I'm not the main programmer of Papyrus
(which is my partner Christian), but I know - and I'm part of -
the close contact to the Behne brothers and the developement of
NVDI ...
And both parties - Chris and the Behnes - DO love to wipe out
bugs ...

So maybe it's a matter of "interpretation", maybe fVDI is doing
this function call "different".
If the normal VDI AND NVDI are doing this call different, I think
fVDI is the one who has to follow, no matter of if the programmer
finds this function call - let's say "ugly" ...

But if the fVDI programmer can name us the function call, maybe
we can do something, even when we think to make clean calls all
the way ...

At the moment you simply have to add the fields manually to the form
(copy old fields, doublecklick the place holder and change it's name
to the new field name).
See the online help for further info, I think I wrote down all the
way, AFAIR ... :-)

In a future version the added fields will be added to the edit form
automatically.

>straight away, and edited the default.svr (Newsie here) with the correct
>NG numbers and it's working fine now.

I too did similar and finally got some eMail tonight, and sent some, but, later on in the evening i tried to grab summat i was expecting to find the pop server is out again, i experimented and discovered theyve reverted to the pop (not pop3) server, so disconnected to re-config, reconnecting i then found this was farked also, so no more email for me.

DO you have any problems like this?, i notice you seem to go quiet frequently!.

And suprise no mention on the status page so i obviously need to upgrade my windows drivers, again!!!

I tried out my old bun and sky accounts to discover there's been no news migration since i dumped them before Chrimbo for this very problem.

Somethings telling me computers dont like me!!!.

Source record: 50504

Writing this I look at a photograph 15 x 10 cm taken years ago (maybe 1990?)
in the Northern Busstation of Calcutta India.
I see a British-like bus (double deck) in a vage dusty red color bearing
advertising boards reading:

ATARI......ATARI

in between those two names is a picture of a TV-set.

Down on the right side of the sign-board some extra strip is added reading:

"COLOUR AND BLACK & WHITE TV"

The Atari names are in a yellow color (that looks like what the Dutch Atari
magazine is using for the cover).
The background has the 'Atari-blue' colour.
The seemingly later added text on the extension board is in red with white
background.

And there is no Atari logo (Fuji) to see.

Very strange is that someone has crossed-out the signs with a half-wet black
paintbrush, somehow making the advertising 'not valid'.

Can anyone tell me what Atari did in India?

The picture rises many questions.

Did they defraud in India and/or did not pay their advertising bills?

Made Atari ever TV's?

I have the picture digitised. Any interest?

Sadly that's all too often the case - and it's not always the manufacturer's site that is correct :-/

SA> Some say its 4 30pin sockets, whereas mine is clearly
> 1 72pin socket...Perhaps apple had 2+ revisions of the
> Quadra 9x0 boards ?

Or perhaps people didn't know what they were looking at ;-)

SA> ...I'm tempted to suspect that Apple would be right.

Probably in this case :-)

SA> There is one hope, that being that I seem to remember
> once upon a time seeing somewhere that the VRAM socket
> can take a 4MB module, and that perhaps would allow 24
> bit (why upgrade to 4MB vs 2MB, if you can't make any
> extra use of the extra 2MB ?)

I don't think RAM is the limitation (obviously I could be wrong) because 2Mb could give you <reaches for calculator> 832 x 624 in 24 bit colour. Perhaps the colour look-up table (or something) limits the on-board video to 16 bit colour.

SA> OTOH, Nubus 24bit cards can be found relatively cheap,
> so its not that big a deal, and the Quadra 9x0 series
> have enough NuBus slots that its unlikely you'll ever
> find enough to fill them :)

That's great news! I imagine that if you had room on your desk for two monitors you could use the on-board video for one (in up to thousands of colours) and the NuBus card for the other (in millions of colours).

Because I spend my whole life in front of a computer, I would ideally run the on-board video with a monochrome (hopefully portrait) display. I could have a second, colour monitor for those odd occasions when it's actually useful to me. Alternatively I could just get out more ;-)

Hello Mark,

M> Well we would pick option 2 as this cuts out all of
> the MS stuff...

There is at least one free version of DOS around, I haven't tried it recently
though.

M> Most simply emulate the hardware as best as possible so
> that TOS and programs think they are running on a ST,
> TosBox works a bit differently in that it translates
> TOS call to DOS calls which gives it great stability
> and speed when it comes to apps but it is useless at
> games (Gemulator may also do this).

I've been quite pleased with TOSbox.

M> I was considering looking into the PC GEM to see how
> that work and if it still resembles Atari GEM.

Well, the source code is out there for you to take a look. I would like
libraries that I could use to develop code which could build under DOS and TOS,
and optionally give me access to GEM on either platform.

ASB> The problem that springs to mind is that the PC BIOS
> is real mode and so limited to 1Mb (of which only
> 640Kb is usually available RAM).

M> I thought that may be a problem too, this is only a
> real problem for memory though (and maybe Video) both
> of whivh coudl be used directly and other functions
> such as Keyboard, hardisk, etc, etc coudl still be done
> via BIOS, no?

No. If the PC processor is in real mode, you have access to BIOS, but not more
than 640Kb of RAM (without cludges). In protected mode you've got access to
all the RAM, but not BIOS. Some 'DOS extenders' work by living in protected
mode, but switching back to real mode for BIOS (and perhaps DOS) calls.
Obviously there's some overhead to the switching, and it's not a particularly
'clean' solution - bear in mind that this is the PC we're talking about :-(

One potentially interesting tool is DJGPP (I think). It seems to be a port of
GNU development tools to DOS (it uses a 'DOS extender'). Used right (and with
the right libraries) it might enable me to write code that will build under DOS
on the PC, TOS (or MiNT) on the ST and possibly unix in its various
incarnations and platforms. I think I read the other night about libraries that

would glue GEM calls to the X window system, so potentially graphical programs that could be developped that would run under GEM or X on TOS, DOS, unix... of course, this is all easier said than done ;-)

MA> Which ones access hardware directly and which (if any)
> simply call functions of others I do not know but I
> think it would help.

I'm guessing that AES uses VDI (which I /think/ grew out of GSX under CP/M) This is really testing my memory, but the XBIOS/BIOS combination rings bells from my CP/M days... I think XBIOS may have been customised to the hardware, and BIOS could be generic (not that there were that many CP/M- 68K computers). I don't know if BIOS worked through XBIOS, but it sounds possible. GEMDOS presumably works through BIOS. It's just a hunch, but I've a feeling BIOS text console routines wouldn't work through VDI.

I would really like an experienced Atari developer to let me know if I'm barking up the right tree here, it's all guesswork.

M> TOS was originally in C I believe, but many of the
> above have already been re-written by people.

Wouldn't it be nice if we could just re-compile TOS on different systems? Unfortunately it's quite simple to write
non portable code in C ;-)

Hello Matthias!

MJ> IMHO, the 640 KB problem is MS-DOS specific.

It's usually associated with MS-DOS because that is the prevalent real-mode operating system for the PC. I imagine CPM/86 suffered from it too, although it would have dealt better with any extra RAM that happened to be available in the bottom 1Mb address space, which is all you get access to in real mode.

You did, but it didn't stop me wondering about the Quadra 950's on-board capabilities ;-)

DC> ...according to the vendor the Control Panel
> offers "Millions of colours", so that could be
> anything! :-)

I think that's Apple's way of saying 24-bit colour, although 32-bit would give you alpha channels for transparency. They refer to 16-bit as 'thousands of colors', I'm not sure whether they provide 64K or 32K colours in those modes.

It's GEMDOS, indeed.

It's definitely nothing that has to do with physical drive parameters.

1881. scan doubler question

Newsgroup: comp.sys.atari.st
Date: 2001-02-07 15:32:50 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3A816AA2.1A8E27B6@siemens.at>
Source record: 50511
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

Is there anybody out there using a scan doubler to connect his ST to
a modern multisync monitor ?
I found two of these devices (with and without flicker fixer ?!)
advertised at a 'software hut' page but haven't the slightest idea
which of them would work better (or at all) with my ST and I suspect
that since 'software hut' is an Amiga store they won't know either.

regards
Gerhard

I recall someone asking for ideas on programs we could all use.
How about a GEM PDF veiwer? I'm aware of gsgem or whatever it
is called, but I've yet to have it let me veiw all the pages.
It always seems to show the first 2 or so and that's it.

Since getting the Hades060 and some rather new PC parts,
all I have for docs are PDF files. This includes the
modem, HD specs, gfx card, sound card, and probably
one I forgot. ;-)

Date: 2001-02-07 16:15:47 UTC
From: Peter Willis <peterw@borstad.com>
Message-ID: <Hzeg6.138790$47.2076158@news.bc.tac.net>
Source record: 50514

I am looking for a Hard drive fro My 1040 ST.
If anyone (in Canada or U.S.) knows where I can
get one of reasonable size please post size and
desired price.
I'm wary of opening my case as the system is
completely untampered with. I would prefer
a drive that plugs into the HD socket on the
backplane of the original case.

I am good with a soldering iron so if anyone
has plans for an interface that connects to the
HD port and uses an IDE drive I'd appreciate
that too.

Peter

>I'm afraid that development work seems to have ground to a virtual halt
>(aside from one or two people like yourself). A lot of commercial stuff
>(like Texel) fell by the wayside a while back :-(

The commercial companies have been falling away for quite awhile.
But I think you are being too harsh on the number of people still
developing software. But that is exactly what I was complaining about.
Look at the uptodate list for January. There are 17 programs that were
updated on there (or were new releases). Doesn't sound like many, but
then again the list does have a slight MiNT bent. Not complaining just
wanting to point that out, that not everything released or updated gets
onto the list. Might not even be the maintainers fault, could just be
people aren't submitting their programs to the list.

If you do a scan around some of the news sites you can easily find
another dozen programs that are not listed or the update didn't make it to
the uptodate list. Then if you start looking at console window MiNT
applications (which the uptodate list doesn't list all of) You can pull in
another small list of probably at least 6 or so. (I didn't verify these
exactly just going on things I have seen elsewhere but aren't listed on
the current updates list.

So as an estimate we can say 34 new clients or updates in january
to be fair? I think this is fair even if it sounds high from the outset.
If you go through bebits for the last months and throw out the duplicates,
icon sets and simple scripts. You get a number that's no more than twice
this size.

I'm estimating on all this. I started to do the real work, but I
think from the work that I did do, that this are valid.

I don't think that's too bad a comparison. Considering we are
supposedly old and dead and they are a hot modern system.

Cool.

>The resource file for After Dawn (which can be used as a module for
>Bubbles) is still in German so that might make another project.

I did a translation of After Dawn years ago. I'm not certain
where it would be found anymore. Hopefully it's up at the umich archive
or something, as if it isn't I wouldn't have a guess of where to find it
on my machine.

Now we just need someone to do a comparison for one of the online
sites of how it runs compared to it's predecessors etc.

1885. FS C-LAB Falcon CAF 8out

There are an option for divide the CPU load 'Force in mono' in the Sound
Configuration Box. Without DSP, the best way for play all MP3 is a
68060 because the muls instruction is very fast on this CPU.

>they think it's slow.
>As I mentioned earlier, GEMulator2000 was 4-5 times faster (3 times
>faster than my Falcon+AB040 rather than 50% slower).

You are right- and I was wrong. I have tried those emulators a long time
ago and something must have mixed in my memory. Now I ran a couple
of simple tests (loading and dithering a JPG picture in Vision 3.5, all
tests in GEMBench) on Gemulator, TOSBox, PaCifiST and STonX, and indeed-
Gemulator seems to be several times faster then the others, which
agrees with what you found. On the other hand, PaCifist, TOSBox and STonX
appear to have similar speed- which probably drove me to mis-remember
what I did. I supose that their slowness vs. Gemulator may be at least
partially caused by "16bitness" of DOS.

So it seems that TOSBox, which I asked about, is impressive enough when
one compares it to a ST or a Mega, but pale when compared to a Falcon or
a clone. So that's it about speed. What about compatibility and general
"feel"?

>If there isn't an FPU (which there isn't in any of the emulators I know
>about), GEMBench does the same calculations using integer operations,
>just like it would be done in any non-FPU-aware program.

I found this in GEMBench docs:

>Float Math Test
>
>Multiplies, divides and adds single and double precision numbers. Also
>calculates trigonometric functions and logarithms. Uses an FPU if one
>is installed.
>This test uses the Lattice automatic floating point unit detection. As
>a result it works on any system but does not get the maximum out of
>the FPU. Tests that are compiled specifically for an FPU yield much
>higher results, but do not work at all if no FPU is found.

so I assumed that floating point ops (not necessarily floating-point-
coprocessor instructions) were used. Ok, I know that it all reduces to
integers somewhere inside the code, before it reaches the CPU but someone
making a program in a higher language deals with floating point numbers,
operations and functions.

Anyway, I agree that the GEMBEnch floating-point test is unrealistic
one way or another. I have a memory-mapped FPU on my MegaST, and GEMBench
declares this to be about 15x faster than a no-FPU machine. Yet, all
other applications that I have which use the FPU, do "math-intensive"
operations with FPU about 4-6x faster only.

First, your words are ... hm let's say "unpolite". But "strong" words
don't mean strong argues ...

Nobody have thrown something in our face, because if sbd. would do so,
I think I would remember. Maybe you told us some of your ideas, but
that's different to being right ...

Not the best way to work together, I think. So let's talk neutral
and let's argue.

And Papyrus CAN handle true colour, GEM was there much earlier than
CVG, GEM is the standard, to want to have CVG in THESE days is
somewhat ... old-fashioned.
But not realistic. Multi-platform is the ONLY chance to survive -
or do you really think that an Atari only program can survive in
these days?
If yes, we get much closer to your flying pigs ...

So you have your strong opinion, but that doesn't mean that you
are right. And maybe pigs can fly (once I saw one in a helicopter),
and it's not that difficult to make sth. together with Christian
Witt - because he is a constructive co-worker ...

> Step closer than me. I haven't downloaded it yet I've thought
>about it, but haven't done it.

The new version of Bubbles is even easier to install than the last
one. There used to be an AUTO folder program but it is no longer
needed. I just added the line:

setenv BUBBLESPATH u:\c\bubbles\avbubble.app

to my Mint.cnf and the line:

#run c:\bubbles\bubbles.app

to M_AES.CNF

Unzip the Bubbles archive and put it all in folder Bubbles on the C:
drive and Bob's your Uncle.

You can also download the AfterDawn animations which can be called
by Bubbles but they are not essential.

Then just re-boot.

If you have not done anything else with the disk you can get it back with
programs like disk doctor or Michtron Utilities. There may be some others
that will undelete the file also.

Yes, since NVDI becomes an extra layer of code, everything will slow
down somewhat. The operations that NVDI takes over to a large extent,
such as text drawing (NVDI renders the text to a RAM buffer and asks
fVDI to do a mono-expand blit on that), will slow down even more, in
some cases very significantly.

It should be possible to implement fVDI in such a way that it only
passes screen calls to NVDI when it can't deal with them itself, but
that's not high on my priority list.

>Speedo instead, but that's quite antedeluvian now and doesn't support the

Using Speedo will in no way be better (well, it might be cheaper) since
it has to work together with another VDI just as NVDI does for graphics
cards (except the ET4000).

>printers which NVDI does.

If you're only after the NVDI printer drivers, and don't require its
outline font support and such, you can actually run NVDI _before_ fVDI.
If properly configured, fVDI will then take care of the screen by
itself, with no slow-down, but pass any calls that create or access a
non-screen device on to NVDI.

So true, Apple's TIL site claims something to the effect of 'Information on
older products have been gathered from various sources, Apple makes no
warrenty on the accuracy of this data, and it is subject to change at any
time', which probably means 'we don't remember anymore, so we just read the
same web articles everyone else does' :)

I believe so. Not all early macs supported dual-display with the onboard
video active, but I believe the Quadra's did (it was probably the MacII's
that didn't).

I've been using pop. (not pop3) since I was connected back a year ago.
So similar to you I tried pop3. and mail. and neither work at all
well. As I said before, this has been quite recent. BTW, mail. has
the same IP as pop. so it may also have the same IP as pop3.

>DO you have any problems like this?, i notice you seem to go quiet
>frequently!.

Yeah, seems OK tonight. I usually replying, but last week or so, I've
been busy butchering a PC tower....oh what fun :) Can't beat it!

I found a good sight that listed some guy's top 10 UK free ISPs.
Tried a few but some were Java, and one, the submit button didn't work
right at the end of the form :(

Web browsing ain't too good either. Basically I sit there with the Tx
led blinking like mad, but nothing coming in on the Rx. CAB sits
trying to resolve. 2 minutes later and it picks up again.

Source record: 50557

Hello Djordje,

DV> You are right- and I was wrong. I have tried those emulators a long
time
DV> ago and something must have mixed in my memory. Now I ran a couple
DV> of simple tests (loading and dithering a JPG picture in Vision 3.5,
all
DV> tests in GEMBench) on Gemulator, TOSBox, PaCifiST and STonX, and
indeed-
DV> Gemulator seems to be several times faster then the others, which

Just decoded and displayed a JPEG (the logo of the website "DVD
Demystified":
DVDDLogo2.jpg) with a slightly optimized and compiled (but at least *very*
slow) version of Lonny's GfA port (http://www.bright.net/~atari/) of a
Quick
Basic program on a (nowadays slow) K6-2 PC with app. 300 MHz and Win 95
(due
to the limitations of TOSBOX even within MagiC PC on 16 colors):

TOSBOX : 110 seconds
MagiC PC 6.1: 20 seconds

DV> agrees with what you found. On the other hand, PaCifist, TOSBox and
STonX
DV> appear to have similar speed- which probably drove me to mis-remember
DV> what I did.

And TOSBOX is even the fastest of them.

DV> I supose that their slowness vs. Gemulator may be at least
DV> partially caused by "16bitness" of DOS.

Every emulator under DOS is slow compared to an emulator under Windows.

DV> So it seems that TOSBox, which I asked about, is impressive enough
when
DV> one compares it to a ST or a Mega, but pale when compared to a Falcon
or
DV> a clone. So that's it about speed. What about compatibility and
general
DV> "feel"?

IMVHO this whole discussion is completly nonsense (but others also are
;->).
If todays PCs are not fast enough for emulation to let the clones see the
dust, wait 3 months for the next cheap "number cruncher" from AMD or

Intel,
or buy just a Mac Power PC. Although MagiC Mac is not that compatible
(MagiC
PC is, beyond "hacking" games, the most ST compatible emulator existing -
at
least running TOS instead of MagiC - but of course, there is no problem to
install multiple emulators for the needs you have :)), it is the fastest
ST
platform one could have - now and in the foreseeable future.

And for those, who can't or won't afford an Apple (of course, an iMac is
nearly not affordable compared to an Atari clone >;->), but hates MS:
Replace
the BIOS logo (i.e. "Energy Saver" logo) at startup with the Fuji and
start
MagiC PC automatically as fullscreen application. ;->

But: Keep on discussing! It's just like a daily soap - not that high
level,
but nearly entertaining ... >;->

... at least much more entertaining than those elder people with "Watch
Tower" (? in German "Wachturm") standing around, wanting to spread
religion,
which no one else wants to participate.

PS: *JEHOVA!* >;->

Greetings, Oliver

Hi Johan,
I didn't know this until after I wrote my message. having been away
from Newsnet (and anything Atari) for a while I'd completely missed
your project and didn't know what it emulated and what it avoided.

>> and a s long as they respond to user-concerns then it becomes
>> viable, yes.
> 'they'? I'm usually only one person. ;-)

Sorry again. I didn't know who was working on it at the time.

>> It's certainly true, though, that NVDI for graphics cards are a
>> long way from reliable IMO.
> What reliability problems have you seen?

The VMG program could do with an update (I know that's coded by
someone else, but nothing else is available I know of) and the way
NVDI seems to rewrite the NVDIVGA settings in a particularly
destructive way are my most major problems.

At various other times there have been other bugs which seem to go
unfixed because it was never the "standard" version and they probably
didn't have the setup to duplicate the problems.

This is only a suggestion but I've got it to work in other applications.
Try it at your own risk.

Mix some quick-setting araldite (epoxy) and dribble a little into the post.
Don't fill the hole as the screw will need space

Grease the screw & insert it. Allow the araldite to set, you can test the
bit left when you mixed it. When it's set unscrew the screw & leave the
araldite to cure fully (overnight) If you're lucky you should have a
serviceable thread. (fingers crossed)

>>Hopefully it would be better in the full version? If this is the case, it's
...
>Well, let the figures speak:

For reference, I thought I should include my numbers from a Falcon+AB040
with an Eclipse/RageII at 1024x768x32 bit. This is with the configuration
I normally use (though I don't often run in 32 bit mode), which means
that some blits are cached. In GEMBench the cached blits affect the
'Blitting' and 'New Dialogs' tests to rather significant degrees, but I
don't really consider it cheating since it works well with the vast
majority of software and is very useful in practice. I certainly didn't
implement it to cheat on GEMBench. ;-)

Of course, as I often say, the tests in GEMBench aren't terribly useful
and several don't really measure what they claim to do.
VDIBench numbers would be a more interesting comparison, but please
note that the current releases of that have a bug which causes one of
the blit tests to crash (so don't run that test).

>GEM Dialog Box: 0.335 2000%
0.945 708%

I'm running under TOS, which is significantly worse than MagiC for this
benchmark.

>VDI Text: 0.145 5137%
0.140 5321

Funny that they should be so close!

>VDI Text Effects: 0.430 3406%
0.310 4725%

Now, that is downright terrible numbers on the Mac!

>VDI Small Text: 0.075 8266%
0.110 5636%

I wonder why MagiCMac is so much better at small text than at the
other text tests. Still nothing to write home about, though.

>VDI Graphics: 0.995 1678%
0.605 2760%

;-)

>GEM Window: 0.490 765%
0.435 862%

I thought the G4 should have a better graphics card than that.
Perhaps you have a normal desktop with icons, background images and
stuff behind the window? That can make a _huge_ difference here.

>Integer Division: 0.095 3278%
0.940 331%

Usually more or less linearly related to clock speed (most division
hardware will deliver one or two bits per cycle), which fits nicely.

>RAM Access: 0.010 32200%
0.225 1431%

>ROM Access: 0.010 22500%
0.225 1000%

Those tests probably fit in the caches of the G4.

>Blitting: 3.080 282%
0.740 1175%

Now, fVDI may be caching blits here, but that G4 number is appalling!

>VDI Scroll: 0.275 5454%
1.040 1442%

Much better!

>Justified Text: 1.325 716%
0.510 1862%

Really strange!
Unless the justfied text code is extremely bad, this test is really
completely fill rate limited. The G4 shouldn't do as bad as that!

>VDI Enquire: 0.010 20500%
0.130 1576%

Unless MagiCMac has PPC code in its VDI (which would be very surprising
giving some of the other numbers), this should be a relatively decent
CPU speed test. Only as long as the same, or very similar VDIs, are
used, though, unfortunately...

>New Dialogs: 0.600 1425%
1.405 608%

Again, fVDI is caching the background, but the G4 number still doesn't
seem too good.

>Graphics: 4511%
2425%

>CPU: 19326%
920%

>Average: 7686%
2102%

>MagiCMac 6.10.1 running on a G4/400Mhz with OS9 in 1280*1024*16.7 million
>colours.

Sorry, I can't run in 1280x1024x32 bit with a 4Mbyte RageII, but with
modern graphics cards the resolution doesn't usually matter a whole lot
to the drawing performance.

>Reference is a standard Falcon running in 640*400*256

Same with mine, of course.

>On average this monster is 195 times faster then a Falcon, 775 times faster

GEMBench's 'averages' don't really mean anything, but it's clear that the
G4 is _very_ much faster than a Falcon.

A rough estimate would be somewhere around 10 times faster than my
Falcon+AB040, perhaps as much as 20 or as little as 5, on CPU intensive
stuff. Compared to GEMulator2000 on my Duron/650, which managed to
outpace my machine by about three times, that is not bad at all!
IIRC, the later Apple 68000 emulators used techniques similar to the
Alpha FX!32, which has been mentioned earlier in this thread, and the
Tempest. That is, it actually generates native assembly code and keeps
it around for later. IIRC, it's not supposed to be as 'smart' as the
other two, though.

>In real time figures this translates to Imagecopy displaying GIF in real

What do you mean by displaying an image in real time?

>time, 2.5Mb TIFF in 0.5 secs, and heavy packed JPEG's in a second.

What size JPEG is that?

>but don't forget that in addition to fast emulation you get speedy graphics,
>heaps of RAM and very fast harddisk and CD-R transfer speeds thrown in as
>well.
>Compared to a PC running an Atari emulator this is a Formula one car...

A PC emulator with a good (GDI/DirectX) fVDI device driver should be able
to slap it silly when it comes to the GEMBench graphics speed numbers, if
the above is anything to go by (MagiCMac might only make use of the
hardware acceleration features for a few operations, like the scrolling).
For the time being, it appears MagiCMac does the same to the PC emulators
for pure CPU emulation speed, though. And of course, there is no such
fVDI device driver yet.

I just bought an old PowerMac 7100/80 and will hopefully be able to run some tests on that within a week or two. I'd expect it to run emulated code at speeds similar to my AB040, but that remains to be seen.

This would require you to use SCSI. For what it's worth, it is rather
easy to open the ST.

> adventures. I'm hoping to save a few bucks up and get the software
> to do it myself one of these days since I inherited a burner.
OK, in a nutshell...
Bought Panasonic CDR7502. Used it as a CD reader for years with
Extendos.

Bought Extendos Gold and CDWriter.

Installed software. Nothing worked. Contacted Anodyne.

Within days patched software arrived via email. Backup and ISO9660
work with very little effort (see D. Acklam's article in MyAtari for
more detail). "Simulate" feature still a bit flaky, but who cares when
media is 49 cents?

Started weekly email to Anodyne over audio CDs and my inability to burn
them. Anodyne started weekly attempts to solve problem. So far, not
successful and I'll probably have to ship hardware to Anodyne for
testing.

Conclusion: great software, great service but next time, buy Yamaha.

> Well here is a start.
>
> Anyone try the new Calamus Lite shareware version yet? Hows it

1922. Re: Hard Drive partition

Newsgroup: comp.sys.atari.st
Date: 2001-02-08 00:48:43 UTC
From: Nicholas Steele <a@b.c>
Message-ID: <L1mg6.4629$ef6.31586@news1.gvcl1.bc.home.com>
Source record: 50599

The root sector of a disk uses a long to describe the size of the disk
in 512 byte sectors so you would think some BIG drives would be supported,
but GEMDOS looks like it limits the total number of bytes in a cluster by
using a WORD which may be the cause. Just my guess.

Nicholas Steele

maximum size of a cluster in bytes = 16384
size of cluster in logical sectors = 2
maximum size of a logical sector in bytes = 16384/2 = 8192
maximum size of a partition in logical sectors = 32768
maximum size of a partition in bytes = 8192 * 32768 = 250MB

Right. The point is that a 56K modem will help, but won't double your
download rates.

> Harry Sideras did a message which looks really helpful but he did not

One of the TTs ports is quite unusual. The hidden "Serial 2" port is
standard and rates to 230K, if I recall.

FamilyNet Newsgate

Hello Nicholas!

NS> The root sector of a disk uses a long to describe the
> size of the disk in 512 byte sectors so you would
> think some BIG drives would be supported...

<reaches for C manual> ...if a 'long' in this case is 32-
bits and an unsigned integer...that would make for nearly 2.2Gb I think, which
is adequate for many uses.

NS> ...but GEMDOS looks like it limits the total number of
> bytes in a cluster by using a WORD which may be the
> cause. Just my guess.

It's done by cluster? Wierd!

NS> ...maximum size of a cluster in bytes = 16384

Oh, then a word is 14 bits? Now I'm confused. I'm going to try to follow this
step by step.

NS> size of cluster in logical sectors = 2

So, a 'logical sector' is different from a 'physical sector' (implied above as
512 bytes).

NS> maximum size of a logical sector in bytes = 16384/2
> = 8192

Ok. Not what I'm used to, but I can just accept it.

NS> maximum size of a partition in logical sectors = 32768
> maximum size of a partition in bytes = 8192 * 32768 =
> 250MB

I make it about 268Mb, but people's definitions of Mb vary.

So these definitions of sectors, 'logical sectors' and clusters are part of
GEMDOS? If I were to make a call to GEMDOS, would I refer to a location within
a partition by
'cluster number', 'logical sector number'...or what? I guess
I'd like to know what the unit of my request would be, and the format in which
I present that unit. Ditto for BIOS if you have that information to hand.

Regards,
- Andy.

1934. Swap: Falcon for MegaSTE

Newsgroup: comp.sys.atari.st
Date: 2001-02-08 01:56:17 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <eyNhqwDBzfg6EwA+@lovecraft.demon.co.uk>
Source record: 50609

I'm not giving up on the Atari, but I think the Falcon was more than I
needed for MIDI stuff.

Swap: Falcon, 14Mb, FPU, 215Mb internal, 1Gb + 540Mb + Syquest + CD-ROM
in PC case, VGA display, some random software and CDs, for the best
MegaSTE with TOS 2.06 and HD floppy drive, MIDI expander and Mono
display I am offered. Must be a MegaSTE (assuming everything goes well,
I want to order a Galaxy card and hook it into my home network) and must
be in good condition, HD should be a decent size. No upgrades or
accelerators other than additional RAM if possible!

TT with at least 4Mb ST-RAM and 8MB TT-RAM considered. Would just keep
my monitor in that case, and not worry about having a monitor for the
TT.

Serious offers/suggestions only, please.

Richard

Hello Galen!

AB> ...I would avoid MNP5 compression if you're using it to browse
> the web. See your modem manual for details.

G> Why avoid MNP5?

My understanding is that MNP5 wasn't smart enough to turn itself off if you were sending data that wasn't significantly compressible, I'm told it could actually slow things down. Note that I said the Web rather than the Internet as a whole - I was assuming a graphical browser. Most web sites feature GIF and JPEG image files, neither of which are really compressible. I imagine the same is true of PNG image files.

Regards,
- Andy.

I have some sort of Radius video capture device, and the splitter allows
for a second monitor. I think at the time I was using O/S 7.5.5 on the
950, and was able to identify each display. Also, I think that Apples
"thousands of colors" is actually 15 bit, but I would leave that
discussion to the technobods. I also tried a 50Mhz 040 accelerator on a
Q900. Was very fast, but so many conflicts and problems that it isn't
worth while. My Q800 has a 601PPC upgrade, I think 120 Mhz. It's no PIII,
but surely is faster than the standard 40 Mhz 040. I don't have MagiC
working on this setup yet. Think I need an upgrade.
I think you mentioned something about different V-Ram slots. I noticed
that between a couple of Quadras I have. One takes more chips, but I
think the memory works out to be the same.
Can't wait to get my 060 Falcon going:)

Mike

So, you are running the current version 3.0 under MiNT? How did you get it running?

Tschuess,

Frank

Tschuess,

Frank

P.S.: Does anybody know that there exists a ROM-PORT networking card with drivers for MiNT/STinG? I have bought it and it works really fine.

Galen,
Ctirad sent me a Phantom SE back in Dec. 2000 (took a month or two)
He sent it before getting paid and am trying to get his address to send
some bucks to but he has'nt returned my E-mail!
I have'nt installed it yet either (have to be in the mood). The main
board is only about 1" x 2", a second board 1" x 1/2" and also a separate
chip (all pre-wired). Hope he's still active!!!

The resource file looks pretty small, so I wouldn't mind betting that
there's loads of text embedded in the binary as well :-(

> Now we just need someone to do a comparison for one of the online
>sites of how it runs compared to it's predecessors etc.

Seems (Bubbles) to work fine, unlike another saver I tried whose name
escapes me, which didn't get on at all with Appline. As soon as the saver
kicked in it would immediately be kicked off again!

>Who will recommend a client for use with Magic on a TT with Sting (including
>a link to download/purchase)?

All these will do email.

NEWSie http://www.primenet.com/~rojewski/newsie.html is popular, but some
folk have reported problems with file corruption. Seems that it's a good idea
to use the menu item "Disconnect from server" and quit from NEWSie before re-
running it to read your ng messages.

Atack's AMail is up-and-coming, http://www.pwp.cz/atack/ (See earlier message
in this group which details how to configure it for newsgroups)

Eric Hall's MyMail is slated to have newsgroup capability (soon?)

Okami is arguably the best, does need some time to configure fully

Most if not all these progs can be downloaded from the Chapelie ftp server.

There are no commercial clients for STinG/STiK, although at least two of the
above are shareware.

Right, I've just reviewed the emails that passed between Harald and myself before I put the utility up on my web site, and he gives permission to make the source code available. I didn't bother uploading it, but if you have PureC and know what to do with it then perhaps it could be recompiled to work correctly.

No doubt you could also turn it into an auto folder prog which would make life easier at the Atari end of things.

First though, you'd have to sort out the margin properly. I guess that the Diablo emulator prints correctly?

Well just off the top of my head with only 1/2 a cup of coffee in
me early in the morning...

Most of the entries from the Magic Gaming competition. A few
older games, mostly Tetris type clones. There are more. My brain is
just drawing a blank at the moment. There is also a problem with some not
being properly linked. Like GemNethack. There is Warwick Allisons
version listed, where the most current version is by Christian Bressler.
There is also another game along the same lines of Nethack the Mr.
Bressler ported to gem as well.

Exactly it's in mailing lists or on the right IRC channel on the
right night at the right time. I understand why this happens, (or at
least have a theory that applies to me ;), we are a hobbyist platform.
Programmers like to program. Programmers work away madly and get
something done, then spend up to 5 minutes sometimes sending mails about
it or news out. About this time one of a few things happens, you have to
go to work/bed/hospital or you suddenly realise the answer to the
programming problem you've been working on and if you just went into the
code and...

My thought was just if you were on a mailing list and someone said
something was publicly released. It would be nice and probably helpful if
interested people on that list helped spread the word, so that the rest of
us in the community can find out about the port/update/etc available for
use.

>
>> An english discussion on the Bubbles Screen saver.
>
>It works and looks good, what's there to discuss ;-)
>

Well so far eveyone has said good things about it. So maybe a few
people that didn't know about it have gone off and enjoyed it. With the
english translation maybe even more people will enjoy the use of it.
That's why it's worth discussing.

>> What's the state of X86 Tos projects?

Unless there is another set of pages from what I've looked at they
are pretty much stalled again. They go in bursts. But I get the
impression that the Programmer to User ratio is probably 4 to 1.

>> that list think that everyone that is interested is on the list. Not

I do. I also follow linux fairly closely, so I know what alot of
these things are. I think a litle further promotion from the community
would be worthwhile even though some would complain ;) While I use Magic
most of the time on my TT, I'm not adverse to knowledge.

To my knowledge their is no easy way to incorporate Javascript
into CAB without the code. This is what I've been informed. It would be
very hard to do it without modifying the code to some extant as Javascript
has more to do with the modification of the layout and user interaction
then anything with the transport of data (where my program comes into
play).

However if you've been following other news sources(hey we are
back to my complaint) Robert Goldsmith is hopefully going to have
HighWire up on SourceForge soon. This has alot of benefits even if it
will make early development troublesome.

Anyway I guess what I'm trying to say there is with Highwire,
javascript implementation should be possible as soon as the source is up
and we have someone interested. We probably should see if John Rojewski
released the code to his port or if it is dog easy or something for
javascript on the atari.

Hi all,

Can anyone verify that the following is due to different directory structures. A CD recorded at a recording studio, contained a 11Meg Wav file from Cubase VST and a folder full of WAV samples. On my (son's) C-Lab Falcon with ExtenDos, only the folder and samples were visible and playable, and on my Milan with Spin only the big WAV together with an auto generated PRG launch file were visible and playable. Is it possible to have both/all visible and accessable with one system?

Bob King.

Good solution. I've also used araldite (good stuff) to mend things.
Using grease (I usually use motor oil) works a treat, just stops the
epoxy bonding with it.

>That was one of the great bargains and I really wish I had bought one
>(finished saving for a CT2 about the time they ran out). If I recall,
>the Phantom website is down ... am I wrong?

A few days ago it was up, so I suppose it still is. Maybe the URL
changed, do a search. I quite pleased with it, and I've made a
little mod for it to have an LED output for Turbo mode, as I have the
Falcon recased, but this could be done to for a normal case as well.
Should work fine with a CT60, and I'll probably be trying it. :)

I had two supplied with my Falcon, aparanty the guy who makes them sent
them to him free :-/

Quality of the board is poor, but it is cheap. I'd recommend checking
all chips for solder whiskers.

Performance is good, probably on par with the Nemesis. Specs identical
to the Centurbo 1 I think, but this also includes clock patch and
44.1khz clock.

I got a reply no problems, the card is not cheap though, about US$220 for the card and an extra US$45 for the additional memory, the network version is about US$260.

This was in December (17th), he also said he would not supply it to be used in a MegaSTE as it had not been tested (that was 6 weeks ago though).

Hopefully the network version should be out soon, mail him again.

Mark.

PS Just in case people don't know about the card

Source record: 50641
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I bought this without realizing it didn't have a built-in modulator!, so I couldn't test it, but I recently managed to get a RGB/Scart lead. It booted with a black screen. The system works, I booted a game disk, but the screen is black. I pulled the video chip (Shifter?) and put it into a 520STFM and it works. Tried the chip from the STFM on the STF, but still black screen.
The solder looks ok on the bottom of the motherboard, so I'm stumped!

Thanks,

--Bill.

1968. Mustek 12000 (quick response)

Newsgroup: comp.sys.atari.st
Date: 2001-02-08 18:41:13 UTC
From: bindon@madasafish.com
Message-ID: <t85q294voj9od6@corp.supernews.com>
Source record: 50642

Hi everyone,

I ordered a Mustek 1200, and it arrived some days later, but as I got it home I realised that the box said 12000. So I thought I'd try it anyway.

HDDRiver picks it up fine, but Homa House systems drivers don't work, they just report "Wrong Mustek Scanner". I carry on and it hangs on the "Prescan". Tried GTLook as a last choice, but I think you can tell what the result is there.

So I took it back and told the guy he ordered the wrong scanner, it even said 1200 on the receipt. The dick <sorry about the language> said "Oh, It'll work anyway" but it still doesn't. He reuses to take it back, moaning about students always taking things back blah blah blah. You get the point.
The guy even said the 12000 was a 1200 with an extra zero on the end.

So is there any other drivers that'll work, or do I go back and tell him to FO?

Thanks guys

Lyndon Amsdon

OKAMI: This is really *the best* non commercial mail/newsreader
currently available for our beloved platform. It's the most versatile
program I know. It's maybe a little bit hard to set up but it's really
worth the effort.
Mind you Okami is a real offliner. To retrieve mails and Usenet articles
you need Popwatch (Mail) and Newswatch (Usenet).

Source record: 50625

If you don't have Diamond Edge you can use a low level disk editor (such as Knife ST which there have been demos of), doing a sector by sector search you should be able to find the file name minus the first character (e.g. 'song1.mid' would be '_ong1.mid'). Once found simply add the extra character to the file.

At worst a DOS 5 PC should have an undelete that will work as long as you have formatted using FCOPY or on a modern STE, TT, Falcon, etc.

Do not add any files to the disk, or you could lose the info.

Mark.

I would find another server before using Demons FTP site, or until/if it
gets an upgrade. At the moment their server seems to be getting slower
and slower, as well as more unreliable. It took just over 3 hours to
fetch the Turnpike 6 beta, (16,542,309 bytes) at 2am with only 7 other
users on the server.

Regards,
David Bolt

Convert first the pdf into ps by means of pdf2ps.ttp. Then you will be
able to view all the pages. This way I've printed out a 150 p manual. It
really works but even on a Hades it's rather slow.

From: jeffm@nbc.netcom.ca
Message-ID: <ytCg6.1642$D3.6204@tor-nn1.netcom.ca>
Source record: 50550

Every year or so I try and gather up BBS softweare for the ST and 8bits, though primarily the ST. I ran a BBS for 7 or 10 years, and have a reasonable amount of stuff (10 or 15 floppies), thogh my many megabytes of stuff went away due to my bbs HD's dieing.

I've been doing a lot of emulation work over the years, keeping Arcade games alives,and working on emulators for old computers. I've been porting old applications to unix to give them new life. I was trying to buy BBS Express from Sanchez a year or two back, but lost contact with him, though I'm dieing to find him again to buy it nowadays..

I need anything and everything BBS related for the ST! I'm having trouble finding this 1.98a relase of Express that has unlimited use without a key (I think I lost my key on my hard drive :/) I'm tempted to build a telnettable version of it. Yes, I know how to do it in many different ways, but its a lot of work. Still.. I've ported TradeWars and Space Empires Elite (old old versions) to unix, and would love to get them online for telnet play.. but really wouldnt' want to do it wihtout my beloved express...

Anyone able to help me out? I have disk space and an ftp server.. I can open it up for a big dump if someone has the files :)

Any BBSes still around?

jeff

Hi John,

I'm in Newfoundland. I don't have a monitor to sell you but thought I'd mention that I have my TT connected to a 17" Optiquest SVGA monitor. I can get resolutions up to 1024x768. Does your TT have a video card? I'd love to hear from you.

Thats interesting, so why is it supplied. I have it installed atm, i'l
experiment with removing it.

>Unzip the Bubbles archive and put it all in folder Bubbles on the C:
>drive and Bob's your Uncle.

Actually, Bob is my da, and also my brother.

>You can also download the AfterDawn animations which can be called
>by Bubbles but they are not essential.

How do you achieve this, i had some kicking around and i popped them in
the modules folder and they dont seem to get picked up, or are not shown
in the config options?.

Reference the start of this thread, It was a good way to get some traffic
in here, but the reason i didnt mention bubbles 3 specifically is that i
had a working reliable Bub2 setup, Bub 3 didnt seem to add anything new
so i didnt need to ask any questions. Nice to see some traffic anyway.

It would surprise me if STonX/DOS doesn't run under some kind of
extender and thus uses 32 bit code. gcc for DOS always does that, IIRC,
and that's a rather likely compiler to use for a program that originally
came from the UNIX world.

>>Float Math Test
>>
>>Multiplies, divides and adds single and double precision numbers. Also
>>calculates trigonometric functions and logarithms. Uses an FPU if one

Those trigs and logs are one major reason for the mediocre GEMBench
float numbers on an '040/'060 with FPU (they are not implemented in
hardware).

>>This test uses the Lattice automatic floating point unit detection. As

That is the other.

>>a result it works on any system but does not get the maximum out of
>>the FPU. Tests that are compiled specifically for an FPU yield much
>>higher results, but do not work at all if no FPU is found.

It's of course simple enough to compile two separate tests and call one
or the other depending on whether there is an FPU or not.

>so I assumed that floating point ops (not necessarily floating-point-
>coprocessor instructions) were used. Ok, I know that it all reduces to

Ah, yes, of course.

>making a program in a higher language deals with floating point numbers,
>operations and functions.

Yes, the GEMBench 'FPU' tests certainly use variables and numbers of
type double or float.

>Anyway, I agree that the GEMBEnch floating-point test is unrealistic
>one way or another. I have a memory-mapped FPU on my MegaST, and GEMBench

With an '040 or '060 it's the other way around. Things are much faster
in practice than the GEMBench floating point test would indicate.

I'll have to locate this again, but I seem to recall that it did something
that obviously couldn't work.

>>I can't say I understand how disabling fVDI could have anything to do with
>>this bug manifesting itself or not, but things worked fine once I disabled

!

>>I'll write a small program that you can run to patch your Papyrus, but I'm
>>not sure when I'll find the time for that (probably in the next few days).

Well, it has been more than a few days, I suppose...

>>If you're up to it, you can do it yourself:
>>1. Look for $25020102 in the Papyrus executable.
>>2. Write $4e75 at that position.

Perhaps someone has already written a program that can apply patches
given information like that? Of course, it would only take a few
minutes to write a .TTP to do it, but...

Anyway, I just tested this again and it does work _if_ it is not
applied until after Papyrus has started up!
If the patch is applied on the file itself, no cascading menus will
work, which isn't very nice...
I guess I could work backwards from the point of failure and come up
with a patch that actually does work, though.

Is there any reason to call that function more than once?

Well, I don't think that there will be many more sales because
every Atarian left must have CAB 2.8 by now :-). Maybe the
author want's to keep his programming techniques secret.
I'm getting jealous of the Mac users, they are lucky to have iCAB,
(their only alternative to I.E. ?),there seem to have been 50.000
downloads from www.icab.de as you can see in the press
reviews on that site.

I have seen an MFP do this. It trigger's the Mono detect signal. I had an STFM with a dicky MFP that caused the machine to only work in HI-res. I couldn't see a thing when a colour monitor was attached, just a black screen, and originally assumed the shifter until I got the schematic's and worked it out. Never know could be the same thing.

Only for the sake of machines that haven't got a genuine float math
chip AFAIK. I'm sure in the GEMBench docs there is a part that says
a genuine float rout is called if an FPU is found, and an integer
rout that approximates float math performance if not.

Certainly a 68882 makes a Falcon quite a lot faster when running any
rendering software, from my experience. I forget the actual GEMbench
figures (I have tested with AND without a physical FPU) but it really
made a large difference to that test IIRC...

Kind regards,

> urgent then a new clone?

What? Oh, sorry...hearing aid turned off <click> thats better... ;^)

I am beginning to look at the software compatibility issue in a quite
different light. I ask this question....

What is easier...

a) Creating a piece of hardware that can be compatible with software
that stretches the rules to find speed on original 'slow' Atari
hardware?

or...

b) Recompiling software to run safely, albeit at a speed penalty, so
that MORE HARDWARE WILL LIKE IT!

Answer b) is the one I'm rooting for, and if software authors are that
concerned about extracting maximum performance from the hardware, they
should consider safety first, fine-tuning later. After all the NEW TOS
clones run vastly quicker hardware (an '060 leaves every previous 680x0
in its dust!!), so any speed lost in compiling a SAFE version of a piece
of software is more than compensated for on the new faster hardware.

That approach will make the hardware designers job all that much easier,
so why point the finger at the hardware companies if they cannot create
a machine with full compatibility across the software range? I think its
the dirty hacks made by software authors, to rely on old hardware, that
is the BIG problem...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

...
>>worng, it's AES not VDI! I offered to contact you about it but he
>>said he was going to check WINX first, however I've not heard anything

The bug is in the ROM AES itself.

>>>The problem occurs when Papyrus calls the menu_click (probably only with

Hmm. Now that I took another look at it, I realized that it is actually
a call to menu_attach. The .HYP file I mentioned had another call listed
with the same number for some reason.

>I'll have to locate this again, but I seem to recall that it did something
>that obviously couldn't work.

Indeed. The code at $e30a8c in TOS 4.04 looks as follows:

pea -12(a6) ; Push address of a local variable
move.w 14(a6),-(a7) ; Push a couple of parameter values
move.l 10(a6),-(a7)
move.w 8(6),-(a7)
jsr $e30c40 ; Call bad routine
adda.w #12,a7 ; Remove stuff from the stack again

Now, at $e30c40 we have this:

link a6,#-10
movem.l d7/a5,-(a7)
...
move.l 18(a6),a0
move.l 4(a5),(a0)
...
tst.l (a7)+
movem.l (a7)+,a5
unlk a6
rts

While the beginning and end of the called function may look a bit
funny (the compiler Atari used does some really funny (and often quite
```

non-optimal) things), there's nothing wrong with it.
Let's take a look at where the parameters to the function are in
memory, though:
- When entering the function, the first parameter is at a7+4.
- The LINK instruction will then push a6 and set a6 to point to the
address of its old value. The first parameter is then at a6+8.
a7 will be modified, but lets not worry about that.

Now, where are the four function parameters?
As mentioned, the first one is at a6+8, and that is word, meaning that
the second is at a6+10. The second is a long, so the third will be at
a6+14. The third is only a word, so the fourth must be at a6+16.

But wait a minute!
The program code above tries to fetch a parameter at a6+18!

When I'm running the program and debugging with Mon, the stack value
at a6+16 is $0000c5aa. The program tries to read two bytes further on,
however, and gets $c5aa0000. Now, what you do think will happen when
it tries to write at that address?

CRASH!!

To me it looks like someone managed to use the wrong function prototypes
when compiling this function. The code really _can't_ work as intended,
and I'm at a loss to explain why it doesn't crash without fVDI.
Perhaps something completely unrelated is causing the program flow in
menu_attach to go another way, or perhaps some bad information is being
passed into the function.

If the developers of Papyrus could take a look at the places were
they call menu_attach during a database report, that might turn up
something, but the fault is most likely not their's in any case.

It would really interest me to know why the same error does not crop
up with NVDI.

I really would like to keep it as a spare. I'm not sure where it came
from, try contacting the guy. You know how to fix SMPSU, so you must
be able to do SMD right? Clock patch is a simple high speed AND gate
intercepting the clock for the SDMA. It's the 44.1Khz clock that's
difficult to get, it needs to be programmed I think. The rest you can
do quite easily.

I'm actually thinking of making something that accompanies the CT60.
Some kind of bus accelerator that is more configurable via software
perhaps so you can chose almost whatever DSP/Videl speed, but like
most of my silly little ideas, they never appear.

I just recently acquired a second hand falcon and have a question. Does anyone know if I need a special rf modulator adapter so that the resulting display (onto a sony wega) doesn't produce so much interference? I shut off my other computers, which helped a bit, but whenever I change higher resolutions (i.e vga falcon demos), it gets worse.

> my other computers, which helped a bit, but whenever I change higher
> resolutions (i.e vga falcon demos), it gets worse.

VGA resolution's are not possible on a TV or RGB monitor, this requires
higher scan rates than allowable. How does the Desktop look? Is it
interlacing? What display setting's did you use? and most importantly what
are you trying to run? If you run a VGA demo on a Tele it MAY set the rates
and cause the signal to go haywire. Incedently my Falcon look's great on my
68cm LG;-)

FamilyNet Newsgate

Hello Bill!

B> ...I recently managed to get a RGB/Scart lead. It
> booted with a black screen...

Assuming you've got the TV set to the right input, it's worth bearing in mind that not all SCART equipment implements the full standard. Check your TV's manual to see whether it only swallows composite video through its SCART socket. I'm assuming that the 1040STF will actually output RGB, I'm sure someone will step in if I'm wrong in that assumption. You're sure the SCART lead is RGB and not composite?

Hope this helps,
- Andy.

On 7 Feb 2001 01:33:05 G, John Garone wrote:

Wanted to clear up something.

A few days ago I asked if anyone in the USA had Apex Media v.2.41 to e-mail
me about a possible bug.

John E-mailed me the ApexJPG viewer for some reason.
Which I already had and didn't ask for. But it is Freeware anyway.
John didn't e-mail Apex Media itself.

John, I'm not sure if you know this, but Apex Media is a commercial Graphics
software package for the Falcon.

I wasn't asking anyone for a copy of Apex Media 2.41 as I already have it.

I had found a Bug in version 2.41, which someone else has confirmed.
I think John mis-understood my posting.

I'd like a picture of this also. Note that the Atari-India connection
has always been strong. Recall the Indus disk drives for the Atari 8-bit
and ST computers, and also Atari contracted in India for various
software, AtariWorks coming to mind first.

It is not main memory but Video memory, it is 4Mb standard but upgradeable to 16Mb or something like that I imagine.

Well at the time I got a reply it was not tested on a MegaSTE but I am sure it will work when they come to producing it, the fVDI drivers still need some development though as well.

I am told a month or so for the network version.

That wouldn't be the Cheshunt Computer Club would it by any chance? ;-)

Monthly meetings of Atari enthusiasts held in at the Wolsey Hall, Windmill Lane, Cheshunt - just a hop, skip and a jump from the M25 J25.

The next meeting is at the end of this month, on the 28th to be precise. The times? 1900-2200.

Further details and a map are on my web site, URL in sig...

You can read one member's experiences in the MyAtari magazine at http://www.myatari.net and there's some mug shots too!

Best way would be to give me a short description via private email that
I can pass through to my programmers, so that this can be fixed in
Papyrus, if this can be done easily (what it looks like, I guess).

I hope that there won't be any problems in principal, that the way of
Papyrus calling it's menus is somewhat incompatible, but I will let them
look it up.

What's better than a patch? A real fixed version, hm? ;-)

From: sf0218@aol.com
Message-ID: <20010209074141.03089.00000166@ng-fj1.aol.com>
Source record: 50451

Around the end of '98 I shipped my C-Lab Falcon out for repair. Apparantly it was a difficult fix and the repair/dealer site needed some time. At one point (early 20000) they notified me that my falcon was fixed. I then asked them if they had checked it for the original problem (crashing the hard drive when connecting cdr) and they said no. They called a few days later and said the hooked up a cdr to the falcon and it crashed horribly. Have heard nothing since, although I know they are working on it when they can.
My question is, the bill at this point although no high (a bit less than $300.00), since it's now over 2 years since they've had my machine, should they even be charging me?
Let me know what you all think about this.
Thanks

Hi
I would like to print some of my old Papyrus documents in a post-script file. I think, a printer driver of a printer that supports post-script is sufficient. Does anyone know where to get such a driver for an Atari ST?

Thanks,
Martin

2021. AtarICQ 0.148 released

Newsgroup: comp.sys.atari.st
Date: 2001-02-09 16:04:33 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <9614e9$3q7$1@nnrp1.deja.com>
Source record: 50454

Hi all,

AtarICQ is now up to 0.148 and while this is no major update, it
contains both a few fixes and some changes in the GEM library.

The scheme for TAB:ing through dialogs to select default/active objects
has been enhanced and is well worth a look if you (like me) try to use
the keys instead of the mouse whenever possible ;)

As always, you are all encouraged to register aICQ if you like and use
this program. Thank you.

/Joakim

2022. C-Lab MKII

Newsgroup: comp.sys.atari.st
Date: 2001-02-09 16:24:58 UTC
From: Lord Gaiyan <lord_gaiyan@hotmail.com>
Message-ID: <RPUg6.179$vV4.2409@newsfeed.slurp.net>

I recently acquired a C-Lab Falcon MKII from germany. Haven't received it yet though. I just want to know what you guys think of it. I know it's different in many ways from the standard Atari Falcon. Is it good for upgrading and accelerating? What should I look out for? I guess it doesn't have an IDE port on it either so how hard is it to come by 2.5" SCSI drives or 2.5" -> 3.5" adaptors? If you have any experience or comments on it please let me know. Thanks.

HE is still here, in this room with me, but very busy trying to make a living, and he has parts for a small number of Galaxy boards, I'm sure he will get in touch with people very soon:-)

Hi Peter,

I've done what you suggested, adjusted for my file structure and at
least some thing happens when I click on the drop down menu 'Get News'.
Looking in say my folder D:\amail\news\csast\ I have as well as the zero
length file, csast.box a lot of files starting with NN... then a number
and containing things like:
NNN.news@madasafish.com
which seem to be strings of news message titles from different servers,
including mine zetnet. Clicking on the mail box NEWS->comp.sys.atari.st
still gives 'no messages'.

Are you doing any better?

Bob King.

Thanks,

I have tried MyMail but unfortunatly once I had set-up the server, etc (which I got wrong) it would not let me change the settings, when I had saved them they simply went back to what they were orriginaly. I tried to edit the file manualy but got anoyed with it all, I have now downloaded a new version.

Ant mail did not have enough room for my user ID so that simply would not work, it only has 12 characters or so but many ISPs use your e-mail address as the user ID too now.

I will take a look at the others.

Mark.

Not really. The MKII is the same PCB as the standard falcon, with the same components, except that the modifications in the analog audio section which atari described were already done at the factory (removed bass-boost etc.).

Evevyrhing else is just like on any other falcon board: internal 44pin/2mm IDE connector (for 2.5" disk), external HD SCSI-2.

IDE adapters for 3.5" disks run around 10DM here in Germany.

How do I get it running? I RTFM and installed it. That's it. No problem
whatsoever. It even works very smoothly with memory protection enabled
which can't be said of lots of other programs.

Hi Andy,

I've used the lead with a STFM and a STE, which works fine with those, I assume the RGB port on the STF is no different? I don't know if the lead is RGB or composite, I'll have to check that out.

Thanks,

-Bill.

Amazing... what was the idea in designing a FPU which ignores some of
the most often used floating point operations?

A slow algorithm is maybe even better for testing and comparing performance-
a lot of operations of all kinds :)

>TOSBOX : 110 seconds
>MagiC PC 6.1: 20 seconds
>
>DV> agrees with what you found. On the other hand, PaCifist, TOSBox and STonX
>DV> appear to have similar speed

So his would put MagicPC approximately at the same order of speed as
Gemulator, or somewhat faster (as Gemulator appears 3-5x faster than TOSBox).

Btw. what are the limitations on Demo of MagicPC. I am interested in
trying it but it is a quite large archive to download if it is severely
restricted so as to be unusable.

>IMVHO this whole discussion is completly nonsense (but others also are ;->).
>If todays PCs are not fast enough for emulation to let the clones see the
>dust, wait 3 months for the next cheap "number cruncher" from AMD or Intel,
>or buy just a Mac Power PC.

Well, if nothing else, it is a pleasant discussion, just for the fun of it.
The point was whether it would be more reasonable (faster, cheaper, etc.)
to make an Atari "clone" in software than in hardware. And so we started
talking about whether existing emulators could be adapted to run on a PC
without an underlying OS or with some minimum OS. So I dont think it is
a complete nonsense.

2039. FreeOla connection woes

Newsgroup: comp.sys.atari.st
Date: 2001-02-09 22:53:51 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <961sdvao1@news5.svr.pol.co.uk>
Source record: 50471

Thanks to all those people who gave me suggestions regarding Zetnet & Freeserve.

Following Peter Slegg's advice I have signed up with "FreeOla" and got an account (online - using CAB!).

I have copied Peter's DIAL.SCR & DEFAULT.CFG for STiNG (& STiNG Dialer), putting in my account ID and password. I then try to connect, the dialer works but sticks on "Initialising connection" - after 5 or seconds the Dialer reports "Link Negotiation Failed", the connection is then aborted.

I have connected OK with Iconnect using the terminal mode and then making this information into a suitable script - this is enough for me to use CAB - I don't have an e-mail program for Iconnect therefore I can't use it to access my e-mail account with FreeOla.

I was wondering whether it might be better to make a dial script for entering the username & password in DIAL.SCR, like the good-old-days before I discovered Freeserve used PAP_ID etc?? I see that Peter's script uses a command "FETCH_DNS = TRUE" - I didn't have this in my Freeserve script.

Does anyone else use this ISP here in the UK?

Any more suggestions would be gratefully received!

Neil :-(

Alexander told me he would incorporate Javascript into Cab if someone else would write the interpreter. It really discusses me how he just left Cab high and dry in favor of iCab. I understand it is a money thing, but there should be some loyalty here...

Steve,
The Phantom SE (3 boards) was around $35.00 (US $) and received it
from Ctirad in Dec. 2000. took a month or two to get it and he sent it
BEFORE he got paid for it (never got his snail address and am still
waiting for him to reply with it).

If everything you've said is correct and not biased then they
shouldn't be charging you that much. Bassically they didn't
get rid of the fault, and must have done work that is not neccesary.
They've charged you 300 dollars for effectivly keeping the machine for
a couple of years. Why are they taking so long anyway? With that
kinda service I'd expect it to be done for free.

Didn't need to do that. Took it back and he was worrying about how to get a refund, same blah blah blah again. Finally he took it while mumbling under his breath. So now I need to find the 1200 or for that fact any scanner that'll work. Needs to be brand new though, as they're so cheap these days there's no need to buy second hand. I'm in SW England if any one knows of a good shop/company. No one seems to stock or get the Paragon.

>Don't apologise for the language though - this so-called salesman

According to the web site, the maker sent them out "on approval" and
many people did not return payment OR product.

May I suggest that anyone with a non-paid-for device either return the
product or pay for it?

Flippin 'eck. Took them long enough. Must be worth a fortune...

Don't suppose you wrote down a few years worth of lottery numbers whilst
it was away, did you?

Seriously, sounds like the terminators for the SCSI are failing (at a
guess, if the Falcon is the problem and not the drive), depending on C-
Lab model it should be easy to fix. There's no excuse for that kind of
service, frankly.

Pay by credit card, get your machine back, get a chargeback because the
work is evidently not up to standard, and find a different dealer.

FamilyNet Newsgate

Hi all,

While being an Atari 8 man, I can't deny that I love the Atari ST when it comes to desktop publishing! I was first impressed with it when I found out about Atari Computing, and in truth, I love using page stream and a ST with a laser printer!

Not much for the games, but Page Stream and 800XLDJ (SIO2PC program for the ST.. virtual drives for my Atari 800) make the ST irreplaceable.

Anyway, trying to get my ST together for publishing for a club I'm a part of (mainly because I want to say an Atari did it.. nah!) so I have a few questions:

I understand that the SLM 605 was based off of a more comtempory printer. What was it? I remember someone saying once, and saying that a drum and toner cartridge from XXXXXXXX printer could be bought through office supply stores much easier than finding a Atari SLM 605 specific drum and toner kit. Anyway, this was answered a year ago, and though I'm looking for the message I had yet to find it. I would appreciate any help on this.

Thanks in advance!

Yo Don,

SLM-605 Atari Laser Printer was produced by Epson.

It is the same as the Epson EPL-6000 Laser Printer (Action Laser).

The Epson part numbers are:

IBS-301 Drum and charger unit 10,000 pages
IBS-300 Black toner cartridge 1,500 pages

Epson

800-873-7766
800-445-5054
www.epson.com

310-782-2600

You can special order from any Staples through there in store catalog.

Being a avid Atari 800 fan, I have found the Atari ST to be a great
accessory for the 800 as a virtual drive.

First off, ST XFORMER is a GREAT bit of emulation for the early ST's.
Considering what that program was trying to do, it hands disk operations great,
and does some basic stuff. It is basically a 6502 emulation since the ANTIC
chip (I believe) was not emulated. But good non-the-less. I used that
for a while, and was able to read the OHAUG disk based newsletters with it.

Then in one OHAUG newsletter a program called 800XLDJ was brought to my
attention. Look it up on the internet just like "800XLDJ" and you'll find it.
What it does is allow is for a ST, STE, TT or Falcon to use a SIO2PC cable and
hook the Atari XE (in your case) directly to your ST. The ST can have up to 8
virutal drives, and the Atari XE sees the virtual drives like regular drives.
It is much better than having 8 actual drives hooked up, and works fairly well.
Rick D and myself are two currently using this setup, and it is enjoyable.

Let me know if you have any further questions.

Had an STE once, and if this will help at all, the type of 1 meg simms
that worked in my Macintosh plus worked fine in my STE.

Man I had it easy with the STE when it came to memory install. That
was a nice design!

Doctor Clu

Well my good man, you are in luck....

First off, Wes Newell (of Newell industries who made many modifications
for the Atari 8-bit and 16/32 bit line) currently has a Atari BBS with files up
for downloading. You can reach that one at...

Wylie Connection - (972) 429-7005

I check my Atari newsgroups usually on a Atari 800 my contacting the
following dialup internet BBS.... (sysop has been good to Atari users)

The Family-Net BBS - (972) 496-0650 http://www.family-bbs.net (via web
browser)
www.family-bbs.net (Via telnet)

And there is the BBS run under Atari 8-bit emulation mode that you
can telnet to and see in ATASCII with a ATASCII term program at...

Closer to Home BBS - cth.dtdns.net

Three BBS's. There is also a BBS list updated in 1999... but you
could check them out... the list is at...

http://www.holyoak.com/atari/

Need to scope those out, but ever since Dark Forces BBS went down, I
just lost heart in dialing long distance BBS's. But there are other places out
there as you can see.

Take care,

Doctor Clu

Robert is very busy that's why he decided to go open source with
it before he had reached the state with it that he had originally planned.
But don't worry, while it will take some time to get it all working the
way we dream/wish/need it to work, I think you will see quite a few
programmers on our platform do some tinkering here and there on it.

Here is what I've gleaned from PC publications and classes I've been in
over the years:

Essentially, "Real Mode" comes from the 8086 CPU's way of overcoming the
64k addressing limit of its predecessor 8080. (8085 also springs to
mind, but I've never seen it up close so I cannot comment)

Intel chose to have 64k segments, each of 64k bytes. This would
theoretically have given them 4 Gigs of RAM if the segments were placed
end-to-end, but Intel decided to space them starting at paragraph (16
byte) intervals. So, you have 64k times 16 equals 1 Meg

There was no way to protect one part of memory being overwritten by any
app.

So, to address a byte at address 512k (00080000 hex), you could use (in
hexadecimal) addresses 8000:0 (512k + 0), 7800:8000 (480k + 32k),
7C00:4000 (496k + 16k), 7400:C000 (464k + 48k) or any one of many
variations, with the first part being in a segment register, and the
second half being in an index register.

However, around 1984, Intel released the 80286 chip, which had a new
"Protected Mode" This allowed up to 16 Megs of RAM, but was addressed
differently. The segment registers remained, but changed their name to
beome "selectors", and whose purpose became pointers to a table in
memory, which held details of where the actual memory address was,
access rights and so forth. The offsets remained limited 64k, though.
And memory was "protected" - with a proper OS you couldn't access memory
that didn't exist or belonged to another process.

Similar ideology went into the 80386, with offsets from each selctor
finally growing to 32 bits, along with data register sizes (selectors
remained 16 bits, though).

So, you could not assume that 8000:0 would access address 512k. It would
access whatever byte was pointed to by selector 8000. Which could be

anywhere (address zero, three and a half megs, 22k, anywhere). Or nowhere (uninitialised, owned by another process).

The difference in ideology between real and protected mode meant that a real mode OS or application couldn't work in protected mode, and vice versa

DOS never went beyond real-mode - that was the job of the first IBM/Microsoft version of OS/2.

It's a standard drum and toner. Mannesmann Tally MT905 or 6 comes to mind,
can't remember which. It should have the drum counter module.

>I have copied Peter's DIAL.SCR & DEFAULT.CFG for STiNG (& STiNG Dialer),
>putting in my account ID and password. I then try to connect, the dialer
>works but sticks on "Initialising connection" - after 5 or seconds the
>Dialer reports "Link Negotiation Failed", the connection is then aborted.

Check that you've definitely got HSModem components installed in the right
order, followed by sting.prg and/or sockets.prg (for IConnect).

>I have connected OK with Iconnect using the terminal mode and then making
>this information into a suitable script - this is enough for me to use CAB

You might well find that you don't need any scripting at all. In IConf you
can enter 0,0,0,0 for both local and DNS addresses - IConnect will resolve
the latter when it connects in the same manner that STinG uses if you've got
the fetch_dns set to "true". In the Login page, all you should need is
"Done" and the "PPP" box ticked.

I'll leave you to work out how to modify your sting script to suit :-)

>- I don't have an e-mail program for Iconnect therefore I can't use it to
>access my e-mail account with FreeOla.

Why not take a look at amail? You can grab it from the Chapelie ftp server,
and there's an IConnect overlay to go with it.

>Any more suggestions would be gratefully received!

Keep it simple is my suggestion. Only start mucking about with waitfors and
responds if you really have to.

Hi all,

Well, I bought a PAL Atari 1040STfm but when I connect it to one of my TV's I see everything in B/W. I've tried on 3 different TV and the same happens. Only on one (the only one where I can switch between PAL & NTSC) I see half of the screen in real color and the other half in a distorsioned color. For example, in the GEM desk I see half green and half violet.

Can anyone help me?

Thanks for all!!!

Hi Neil

>I have connected OK with Iconnect using the terminal mode and then
>making this information into a suitable script - this is enough for me
>to use CAB

iConnect does /not/ need a script!!!!!.

Look for an app called iConf.[APP|PRG].

Select 'NEW' and fill in the dialoge.

Now, enter your username and password in the relevant fields in iConf's
'Account' page, adding a phone number, set 'Local IP address' to 0.0.0.0.

Under 'Login' select PPP, make sure there are no script entries apart
from "Done".

Under 'DNS', set 'DNS IP address' to 0.0.0.0 and a 'Initial waitstate' of
2 seconds.

Under 'Services' add your eMail address, real name, username, password,
and your server names as appropriate.

Now select 'Sockets', enter the path to your PPP folder.

Now, back to the 'Modem' section, select your modem port and speed, set
'Handshake' to RTS/CTS, 'Parity' None, 'Data-bits' 8, 'Stop-bits' 1,
'Modem init' should be just atz for initial connect, you can tailor this
later on if needed. The hangup settings are already there, just select
'Modem command'.

Hit "SAVE", i repeat, hit "SAVE", one more time, hit "SAVE". :-)

If this doesnt get you get connected then i'd check youve actually got a
pulse, a phone line and that youve paid your phone bill before looking
elsewhere. :-)

Not the original Mac II. But the Mac IIci has built-in video. In fact, if you were to buy a Mac II series, the IIci is the best all around machine to have. And if you get a Daystar (or other accelerator) and put it in the IIci's Cache slot, you would have a decent machine for older Mac uses.

With later versions of System Software (7.0 and beyond), you could install multiple video cards in the Mac's and have a bigger desktop area that could span across multiple monitors. The game FA-18 Hornet on the Mac supported three monitors to give you a peripheral vision view outside of the cockpit. Pretty cool demo I saw at Mac World.

2090. Falcon can do Ethernet?

Newsgroup: comp.sys.atari.st
Date: 2001-02-10 18:55:38 UTC
From: jeffm@nbc.netcom.ca
Message-ID: <K8gh6.2233$D3.9962@tor-nn1.netcom.ca>
Source record: 50422

I'm thinking of scoping out a Falcon, to goof off with, and maybe
even to see how well it can run Unix (NetBSD or Linux). I'd love to use it
as a termian or xterminal at work ;)

But I need ethernet support, since I've wried my whole house that
way, and of course at work its all we use...

Any ideas?

Anywhere selling useful Falcon kits?

(Can't possible afford a medusa, sadly..)

Cross-posted to:
comp.sys.atari.st,comp.sys.tandy,comp.sys.ti,comp.sys.ibm.pc.games.marketplace,comp.sys.mac.games.marketplace

Hi all,

If you haven't noticed, the GOTCHA (Gaming Obsession Throughout Computer History Association) website has been down for over a week. This is because my (X) host, Emuclassics, has been down for that long and is still down. You can imagine how upset I am about this!

I have just completed the move to ClassicGaming.com. GOTCHA's new address is:

http://www.classicgaming.com/gotcha

Please update any links you have to my site and please help spread the word about the move. It's very disturbing to lose a home you've lived in for over two years...even if it is a digital home.

For those unfamiliar with GOTCHA, it is the home of:

The GOTCHA Awards
The Official Computer Game Collector's List
The Complete list of EA Flat Box Games (and box scans)
Much, much more...

Thank you in advance,
Hugh

Sorry to hear that. Dallas is still struggling. Actually had a meeting
with the folks of one BBS at a pizza place today. Now that was a fun I've
missed!

A little of everything if I remember correctly. And sometimes you will get
mail back from Wes. :)

>> The Family-Net BBS - (972) 496-0650 http://www.family-bbs.net (via web
>> browser)
>> www.family-bbs.net (Via telnet)

Aha... so you know of this BBS?

> Any files I can ftp, or you could drop off on my ftp server?

What kind of files?

No crime at all. We could use a telnetable *ST* BBS.

>> Need to scope those out, but ever since Dark Forces BBS went down, I

> jeff
x

I never got into his file collection. I have the internet for that and it
was free. But to read the messages he pulled together made for some great
reading. I would get in there, capture the messages, and post a message or
two. It was really a blast!

Talk soon,

Doctor Clu

Hi all. The whole web group thing is a great way for like-minded individuals to keep in contact. For those interested, I've set up a web group for the Atari Times. There are going to be a few changes to it as well. AT is going to change a bit from a typically monthly operation, to a whenever-we-get-the-article-written-is-when-it-will-be-posted operation. I think that'll work better.

Anyway, stop by if you're interested in writing Atari articles for us.

2101. help! 14 meg Ram board on Falcon 030

Newsgroup: comp.sys.atari.st
Date: 2001-02-11 03:16:02 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a8603f4$0$70807$272ea4a1@news.execpc.com>
Source record: 50431

Hello,

Tonight I intalled a 14 meg Ram Board on my Falcon.
It was a perfect boot. Atari Logo, 14.3 meg of Ram.
I thought everything was fine.
Tried a few programs, everything was working fine.
Clicked on Lines.Prg (Screen saver) and took a break.
Came back and there were cherry bombs across the screen.
Tried to reboot, screen flashes black and white,
Atari logo comes up, then cherry bomb, won't run through the
memory test.

Does anyone know what this problem might be.

thanks in advance.
ken

2102. 14 meg RAM board in falcon

Newsgroup: comp.sys.atari.st
Date: 2001-02-11 04:03:16 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a860f07$0$70813$272ea4a1@news.execpc.com>
Source record: 50433

Hello again,

Well I let the machine sit, booted it, and everything worked fine.
I work in some programs for a while, then I get cherry bombs.
Then it starts to reboot, now going through the memory test
with XXXX--XXXX--

strange, I've never seen this before.

Did I fit my RAM board improperly?

puzzled?

ken

My error in not paying attention to your Subject line and answered
what I thought you were in need of from the text body of your post which
mentioned Apex but not Media. I believe (as you've stated above) that
what I sent you was Freeware when I downloaded from their site. If I had
the full blown progran (Apex Media), I'd surely want you to pay for it
as I would have (as I've done with CAF at top dollar and quite a number
of programs I've paid for since '87!). I've helped some out with free
modules for CAF but the programmer diserves his just rewards!
John G.

2104. FS: Atari related books and literature

Retrotaku / Zer0-Byte Bookstore offers the following antique computer and videogame books for purchase.

If you are interested in any of the titles, please send an e-mail to retrotaku@otakuboy.com to inquire about availability, or if you have any questions. Full purchase terms are available on the web site: http://www.otakuboy.com

Thank you for perusing the list.

[000098] Winston, Patrick H.; Prendergast, Karen A. (Editors). THE AI BUSINESS - COMMERCIAL USES OF ARTIFICIAL INTELLIGENCE. Cambridge, Massachusetts, USA: The MIT Press, 1984. First Edition. 8vo - over 7" - 9" tall. Cloth. Very Good / Good. Many books on artificial intelligence are couched in theory, what could be. But THE AI BUSINESS is not focused on what could be, they focus on what can be -- for the most part. This book is about commericial applications of then-current Artificial Intelligence programs. What's especially neat about the book is many people from well knowns companies like Atari and IBM wrote these essays. There are also histories of various programming languages and applications, including XCON, Caduceus, WAVE, and PUMA. Also, Artificial Intelligence and Gaming! ON CONDITION: Book is in good, clean condition. The dust jacket is a bit banged up. The light pencil marks on the interior, front end-papers. Have not found marks inside the book.
$12.75

[000003] Sippl, Charles J. , Roger J.. Computer Dictionary & Handbook. Indianapolis, In, Usa: Howard W. Sams, 1980. 3rd Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / No Jacket. Large dictionary of computer terms. Contains a vast introduction to computers and various languages of the time. Of large interest to someone who wants definitions of computer terms from the era -- programmers of classic systems, early languages, obsolete CPUs, etc. Contains a few predictions on the future of computers. ON CONDITION: Back cover has very light, vertical scuffle mark along height. Upper right corner of back cover has small marks where adhesive glue affixed original price tag. Upper left corner of back cover is pressed. To the left of the title page is a small punch mark into the binding, which is not visible elsewhere. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.50

[000005] Scanlon, Leo J.. 6502 SOFTWARE DESIGN. Indianapolis, In, Usa: Howard W. Sams, 1980. First Edition. 8vo - over 7" - 9" tall. Soft Cover. Fair / No Jacket. A very good introduction to the 6502 microprocessor, a popular 8-bit chip in the early 1980s, used in _many_ computer systems including a number of Apple systems, the Commodore 64 and the Nintendo Entertainment System. Great

information on pinouts, how to address the chip, register controls, and much more. Listed as a 6502.org MUST-READ. ON CONDITION: Shelf-worn and creased on many pages. A number of pages were held together via paper-clips. (Grrr..) Many of the passages are highlighted and there are some pencil notes here and there.
$8.00

[000026] Glossbrenner, Alfred. THE COMPLETE HANDBOOK OF PERSONAL COMPUTER COMMUNICATIONS. New York, New York, USA: St. Martin's Press, 1983. First Trade. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Good. Special Edition, printed for industry. This book explains how to get online and get into the wonderful world of BBSs, circa 1983. If you remember the computers from the time -- XT, Commodore 64, Apple // series, CoCo, etc. Goes into remarkable detail on the services of the time, the various communications protocols in-use and upcoming. ON CONDITION: Spine upper and lower edges are bent from shelf placement. Dust jacket creased along edges. Also, a "Compliments of Hayes" sticker is affixed on front, but this may not be a defect, depending on your opinion. First page is stamped with a "from the library of" stamp. Visit http://otakuboy.com
$9.00

[000028] Williamson, Mickey. ARTIFICIAL INTELLIGENCE FOR MICROCOMPUTERS. New York, New York, USA: Brady Communications Company, Inc., 1986. First Edition. 8vo - over 7" - 9" tall. Half-Leather. Text Book. Very Good / No Jacket. Ready to turn your business into an AI heaven? Want to walk into the office and hear, "Hello, Commander. Computer reporting". This book will explain the 1986-state of AI and where it's going. The focus, as I said, is how you can use it in your business. ON CONDITION: One dent on upper spine and slight wearing on spine where it connects to front cover. Very clean. Visit http://otakuboy.com
$7.00

[000029] McClellan, Stephen T.. THE COMING COMPUTER INDUSTRY SHAKEOUT. New York, New York, USA: John Wiley & Sons, 1984. First Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Fair. A really neat tour of the computer industry in the early 80s. All the old favorites and players are here, from AT&T and IBM and DEC to Commodore, Atari, Tandy, Apple (right on the cusp of the Macintosh birth, no less!!!) . Mr. McClellen is warning you, though. "THE COMPUTER INDUSTRY IS GONNA FREAK!" Turns out, he was partly right. ON CONDITION: The dust jacket has bent and slightly creased along its edges. The front of the jacket is foil-stamped, and some of the foil has flecked off in tiny areas and tarnished on one part of the back jacket. Also, bottom left of back jacket has its coating torn, harming some of the text underneath. Book itself has slight shelf-wear on bottom of spine. Visit http://otakuboy.com
$8.00

[000030] Martin, James. DESIGN AND STRATEGY FOR DISTRIBUTED DATA PROCESSING. Englewood Cliffs, New Jersey, Usa: Prentice Hall, 1981. First Edition (?). 8vo - over 7" - 9" tall. Hard Cover. Text Book. Good / Fair. Is James Martin a MAGICIAN? ! You might think so, especially if you check out the picture of him

on the back in Conjure-pose. Here he is in a book (one of many) where he extolls of the virtues (in excrutiating detail) of distributed computing. And, yes, this is way before SETI, way before multi-processing PCs running Windows 2000. So, this guy just might be a magician or at least some kind of prophet. ON CONDITION: Dust jacket is creased and torn around edges. It is intact. Books seems to have been stored at an angle. As such, the whole of the book is twisted a bit on the spine. No pages are torn, but the spine has no doubt weakened. Visit http://otakuboy.com
$8.00

[000031] Schreiber, Linda M.. ADVANCED PROGRAMMING TECHNIQUES FOR YOUR ATARI. Blue Ridge Summit, Pennsylvania, USA: Tab Books, 1983. First Edition. 8vo - over 7&#65533;" - 9&#65533;" tall. Soft Cover. Very Good / No Jacket. A very nuts-and-bolts Atari programming book geared toward Atari's first foray into the world of home PCs -- the Atari 400 and 800s. Covers graphics (ANTIC, specifically) , animation, voice programs, BASIC, disk drive usage, among other things. Includes some nifty programs. And remember: All this can be typed write into one of those Atari 8-bit emulators about the Net. Has a nifty pic of an Atari 800 on the front cover. ON CONDITION: Edge-wear and shelf-worn. Mainly light creasing along spine edges. Otherwise, very clean. Visit http://otakuboy.com
$15.00

[000032] Allan, Boris. POCKET GUIDE: LOGO. Bath, England, United Kingdom: Pitman Publishing, 1984. First Edition. 32mo - over 4" - 5" tall. Spiral. Very Good / No Jacket. A pocket reference guide for that grand, old, "easy" language LOGO. You remember; the one with the turtles that drew lines across your screen. Old programmers know that LOGO is a powerful language with a deceptively simple syntax. This booklet references the entire language. Get the book, download a development environment like WinLogo, and go to town. ON CONDITION: Portion of the original price tag is on front. A minor bubble on the back panel and some light pencil marks on back panel. Visit http://otakuboy.com
$11.00

[000033] Stine, Megan and H. William. MICRO ADVENTURE NO. 2 JUNGLE QUEST. New York, New York, USA: Scholastic, 1984. First Edition. 12mo - over 6&#65533;" - 7&#65533;" tall. Mass Market Paperback. Good / No Jacket. Scarce - 1984 -- Computers were "the future" and kids could have it all for them if they'd just learn how to program. This books brings kids through an adventure in which small BASIC programs kids would enter into computers from the era woud help save the world! ON CONDITION: Slight creases down edge of spine and front cover. Another crease near the spine on the front cover. Both creases crawl along the length of the book. Small dent in the upper back cover. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.00

[000038] Conway, Gerry. ATARI FORCE #11 "By Blackjak Betrayed!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9&#65533;" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were

distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, Blackjak betrays the Force ... But WHY? ON CONDITION: Very small creases near edges of stapes. Otherwise, pretty clean. Color is good. Visit http://otakuboy.com
$8.00

[000039] Conway, Gerry. ATARI FORCE #2 - "Dart Vs. the Warbeast". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has a profile of "Champion". BONUS: Ad for TREASURES OF TARMIN for the Intellivision. ON CONDITION: Some light creases around covers, mostly around edges of staples.Visit http://otakuboy.com
$8.00

[000040] Conway, Gerry. ATARI FORCE #3 - "Pakrat Goes WILD!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has profiles of "Dart", "Babe", "Morphea". BONUS: Full of ads for classic videogames: Frogger, Q*Bert, Pole Position, Popeye, War Room and Masters of The Universe. ON CONDITION: Some light creases around covers, mostly around edges of staples. Visit http://otakuboy.com
$8.00

[000048] Various. ANALOG COMPUTING - DECEMBER 1984. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. 1984 was high-life for Atari Computers. Think about it. The XL series were riding strong and all those nifty new XE systems were just about ready to debut with their 6502c and FREDDY chips. You Atari fans know what I'm talking about. ANALOG was the BIBLE of that Atari fandom. And this issue is no exception. This one's a Christmas issue, with all kinds of ideas of what to stuff in stockings. Big article on Atari-style FORTH in here, too, along with a weather utility program and a game. BONUS piece is the big center spread ad for the OKIMATE 10, the first really low-cost color printer for home computers. Can you say, "Thermal Transfer"? I knew you could. ON CONDITION: The cover is a bit loose from the staples; you can't so much see it as you can feel it. There is an overall warp to the magazine and some creases along the spine. Visit http://otakuboy.com
$8.00

[000049] Various. ANTIC - DECEMBER 1985. San Francisco, California, USA: Antic Publishing, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched.

Magazine. Very Good / No Jacket. CES Buzz. That highlights this issue of ANTIC that hit the stands right before CES'85. What would Tramiel do? Perhaps an enhanced 800XL for 1985? Maybe a whole new direction for Atari computers. This issue has an interview with Jack Tramiel, then-chairman of Atari. Look over the predictions. How many came true? Sample question: "Are you actually saying that within three years Atari is going to market a small, user-friendly computers with the power of a VAX?" Of course, we know the history. But this interview defines it more clearly. Also, ANTIC's ever-popular Software Library. ON CONDITION: Very light bumping on outer corners. The binding is tight and seems a bit warped as this issue inserts a thick card into the binding. Also, some color fade on covers and slight browning on some interior pages. Visit http://otakuboy.com
$8.00

[000053] Various. ANALOG COMPUTING - FEBRUARY 1985. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. ANALOG Mag was one of those Atari Magazines that rolled on during 1985. And why not? The new Ataris were out and it looked like a new set of 16-bit machines based on Motorolas powerhouse 68000 were set to debut at January CES. Wow. Analog kept us all in suspense and in tune! In tune how? Well, how about this issue with all the programming exercise and examples, including the ever-popular Ask Mr. Forth. Not to mention the really cool adventure game -- programmed and ready for you to type in BASIC -- based on a writer's adventures at Vandenberg. ON CONDITION: Very slight bumping and wear on the outer corners. Otherwise, a very clean copy with vibrant color. Visit http://otakuboy.com
$8.25

[000057] Various. ENTER - JANUARY/FEBRUARY 1985. New York, New York, USA: Children's Television Workshop, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. For a short, short time, the Children's Television Workshop even got a bit of techno-buzz in the mid 1980s. ENTER was a magazine geared toward educating kids about the wonders computers. But what could have been a large, preachy magazine about how computers are changing classrooms, is really a neat sensa-wonder publication about super cool things to do with your computers. This ish? 1984-In-Review! The year's "Greats & Glitches". Also, a neat piece on which companies are producing the dreaded "Q*Bert Clones". Plus, a big feature on what laserdisc players are going to do to arcades. Remember Dragon's Lair? ON CONDITION: Shelf-wear along the spine on both covers and along top of front cover. Slight bump on lower right cover. Visit http://otakuboy.com
$8.00

[000074] Atari, Incorporated. ATARI PORTFOLIO QUICK REFERENCE CARD. Sunnyvale, California, Usa: Atari Coporation, 1989. First Edition. 12mo - over 6" - 7" tall. Very Good / No Jacket. Unpaginated - FOLD OUT - Atari was certainly dynamic, wasn't it. After first creating one of the most successful home videogame systems ever -- not to mention their wildly popular computers -- they go on to create a really sturdy PDA-before-there-were-PDAs. The Portfolio was a nifty little handheld that ran a very sturdy and clean version of DOS,

all in memory, for a pretty decent price. People gobbled them up. It's sad that Atari was eventually gobbled up -- and with it any hopes of a newer/bigger/faster Portfolio. But now they're appearing at thrift stores and antique houses. And, blazes, many of them still work. Fortunately, this Atari Portfolio Quick Reference Card will get you up and running in no time. It covers all the apps -- the calculator, address book, diary/calendar, text editor and worksheet -- not to mention the Mini-Lotus-1-2-3 and all of its functions. ON CONDITION: One slight crease in the middle of the first fan-fold. Also a small bump on one upper, front cover. Visit http://otakuboy.com
$9.00

[000083] Various. COMPUTE!. Greensboro, North Carolina, USA: COMPUTE Publications, Incorporated, 1985. First Edition. 4to - over 9" - 12" tall. Soft Cover. Magazine. Very Good / No Jacket. The big mag that wrapped up all the computing news from the mid-80s? (I mean, of course, aside from those stuffy magazines like InfoWorld.) COMPUTE! It covered everything 8-bit: Atari, Apple, Commodore. This issue contains -- ahem -- "TURBOTAPE: SAVE AND LOAD CASSETTE AT DISK SPEEDS" for the Commodore 64 and Vic-20. Other features: a lamentation over 1984's CES (how sucky it was), "1984 revisited" visits the hi- and lo-lights, plus a bunch of classic game ads, include Bally/Midway's foray into home gaming, and a _really bad_ ad for Summer Games from EPYX. Also: Enhanced Applesoft input. ON CONDITION: Very nice. Slight foxing on the upper left front cover. Otherwise, clean with good color and crisp conditions. Visit http://otakuboy.com
$10.00

If you are interested in any of the titles, please send an e-mail to retrotaku@otakuboy.com to inquire about availability. Please see otakuboy.com for full terms.

I'm looking for a public domain ST game called Triple Yahtzee Deluxe.

This is not the original Triple Yahtzee game, but an updated version
with sound effects.

If anyone has this game, please contact me at:

jblenkle@lanset.com

Thats great! If you want you can have complete use of any of the
content on my homepage. I dropped it because of a major lack of time.
Just a couple of ocr'd manuals and some artwork. Mo

> improve it if he did?

Dave Small mentioned to me that he was wanting to release the code for version 3.1 if he found it. I guess he has yet to find it. As it stands though, according to Dave, even the latest version still could not get past the system 7 barrier. :(But still a great bit of emulation that I have fun using.

>
>I did this, it worked perfectly, but today when i grabbed my mail today,
>eMailer insisted in recreating my groups in duplicate, and then refused
>to kill one reporting a GEMDOS error.
Are you sure that's the reason? that GEMDOS error is very weird.... if a
file can't be killed it's either open or something is messed up in the FAT.
Since it worked perfectly before, the trouble you're experiencing now
hasn't got anything to do with the sorted list, it wouldn't have worked
from the very first try...

>It seems eM must be using the positon in the grplist file as an index and
>my shoving them around barfed this up!!.
No not really, the newsgroups in the groupslist are written in lowercase,
when you select a group of your choice, Emailer changes the first letter to
a capital. I'm subcribed to 12 newsgroups, and that's exactly how long the
groupslist is, I've simply deleted all the unwanted groups...

Tip for people with 4Mb computers:
Emailer loads the complete newsgroups listing in memory, when it's a big
listing this means that a lot of precious memory is wasted. To save
something in the region of 500Kb to a 1Mb, truncate the groupslist with a
texteditor, leaving only the groups you want to be subscribed to.

Cheers from Belgium

>reverted to the pop (not pop3) server, so disconnected to re-config,
>reconnecting i then found this was farked also, so no more email for me.
Everyone here must have encountered this at a given stage, the POP, SMTP or
NNTP server from the ISP that goes down, it's just one of those things that
happen and usally always unexpectedly...
A possible solution is GMX (http://www.gmx.net), there are several of these
services around, but GMX is the only one I know with which our CAB has no
problems...
With GMX you have three options:
- read mail online via a browser
- let GMX forward your mail to your ISP based POP server
- log in via your ISP and retrieve the mail from the GMX POP server...

I've set up a system that looks like this:
Under normal conditions all my mail is sent to GMX which forwards it to the
POP server of my ISP. I post and retrieve mails from the POP and SMTP server
from my ISP. So far nothing special...
But if anything goes wrong, I log in via my ISP and then use the POP and/or
SMTP server of GMX to retrieve and post mail turning my ISP into a gateway.

Because of the password control, GMX will first retrieve mail from the POP
server and then send mail from the SMTP server. So one needs a mailer that
works this way (some do SMTP first...).
ASH Emailer is just fine for this...

Hi Johan,

>>On average this monster is 195 times faster then a Falcon, 775 times faster
>
>GEMBench's 'averages' don't really mean anything, but it's clear that the
>G4 is _very_ much faster than a Falcon.
I know that you're not very fond of Gembench, but since it's about the only one that is widespread and very well known... I wanted to show that the Mac is a much faster alternative then a PC when it comes to emulating an Atari. Even the very latest Athlon can't come close.. emulation on a Mac has always been much faster, but in this group people tend to overlook this.
It's only the last couple of years that Atari emulation under a PC runs at acceptable speeds, seven years ago a simple LC475 already outran the TT in speed...

>A rough estimate would be somewhere around 10 times faster than my
>Falcon+AB040, perhaps as much as 20 or as little as 5, on CPU intensive
>stuff. Compared to GEMulator2000 on my Duron/650, which managed to
>outpace my machine by about three times, that is not bad at all!
Exactly, on a PC emulating this kind of CPU speed is simply not possible. And since people in this group are purely focused on speed, an Apple or at least a PPC clone is the route to follow...
One can only imagine the figures of the new released G4/750Mhz...

>A PC emulator with a good (GDI/DirectX) fVDI device driver should be able
>to slap it silly when it comes to the GEMBench graphics speed numbers, if
>the above is anything to go by (MagiCMac might only make use of the
>hardware acceleration features for a few operations, like the scrolling).
The GX Draw functions of the Mac were switched off, I did not want to be accused of cheating since I haven't got a clue if the DirectX screengoodies are used under PC emulation. Anyway, when GX Draw is activated then the graphic output is accelerated quite a lot... so this could explain why you were surprised that the graphic speed numbers were rather slow.
The card in the G4 is the standard supplied ATI 128 AGP. MagiC Mac needs a service pack to run these cards, the normal version 6.10 only works with PCI based cards, it could well be that it's not really optimised yet and that the next official update will improve the figures...

>For reference, I thought I should include my numbers from a Falcon+AB040
>with an Eclipse/RageII at 1024x768x32 bit.
I'm impressed as well, I knew that the Eclipse was fast but never thought it could achieve such numbers, compared to a Nova with an ATI Mach64 it outruns it by a factor 2.5!!

Let's not forget that the majority of the Falcon users don't have a graphic
card, so when they see an Atari emulator in action, they'll always be baffled
by the graphic speed.

>I just bought an old PowerMac 7100/80 and will hopefully be able to run
>some tests on that within a week or two. I'd expect it to run emulated
>code at speeds similar to my AB040, but that remains to be seen.
I don't think it will even come close to your AB040, but a five years old PC
containing a Pentium 200Mhz will not even come close to a standard Falcon...

Cheers from Belgium

>And maybe pigs can fly (once I saw one in a helicopter),
Of course they can fly...
I see whole flocks passing by regularly when I come (crawl) home from the local pub just around the corner... :-)

>GEM was there much earlier than CVG, GEM is the standard, to want to have
>CVG in THESE days is somewhat ... old-fashioned.
The 1ST Word *.DOC was earlier then *.PAP, NEO and PI1 were earlier then JPG and HSV was earlier then WAV... All these formats are more or less standards as well but nobody would even think of implementing them anymore. I would like to see CVG support implemented because most of the graphic applications that support vector objects can output to this format and opposed to GEM there's no discussion about the standard, it either works or doesn't. Implementing the Artworx CWG format limits it to only one package. So while mending one problem you create another one, someone who doesn't have/use Artworx is still stuck. Papyrus supports a lot of bitmap formats, so would supporting a couple of vector formats really be over the top?

>And Papyrus CAN handle true colour
Of course it can, but the supported GEM Artline format doesn't support that mode so it's of no real use. One can load a GIF in True colour also, but since it only supports 256 colours there's no advantage either...

>But not realistic. Multi-platform is the ONLY chance to survive -
>or do you really think that an Atari only program can survive in
>these days?
To be honest.. I don't give a damn what is available and runs on the other platforms.... The Multi-platform Atari apps have turned into big clumsy ugly monsters that need at least a Milan or Hades to run at an acceptable pace, that's the reality. It might be your only chance to survive but it certainly will not stop me surviving.
I use only one Multi-platform Atari app, all the others are Atari-only, and guess what? these aren't clumsy slow running monsters... I rather survive with what I've got then following the multi-platform path.
Papyrus is proof of this... throw out the STGUIDE hyp help and replace it with a weird text based help system. Any modern app uses Gem-bubblehelp these days which sadly isn't implemented in Papyrus. These are just two examples of the virtues of a multi-platform application, unfortunately not very good ones... you may call this surviving, I call it loosing out. If Papyrus would have been a Atari-only app then STGuide help would still be there and BubbleGemhelp support would have been implemented also :-(

>Yes. Artworx didn't follow the standards set by the first - and well
>known, in this good old times - program being able to create
>coloured GEM graphics - Xact.
Xlab introduced the new format in Xdraw not Xact, incidentally that program
knew all three formats, the original GEM metafile, the GEM/3 standard and the
sub-standard GEM/Artline which Xlab tried to introduce. Since Xact only
outputs coloured graphs, there was no need - in that period- to include the
GEM/3 format.

>So what we did in Papyrus is that we implemented coloured GEM
>graphics, done by Xact.
Which at the time that Papyrus was developed was superseded, in fact none of
the leading apps in that period used it at all, they've decided to implement
the GEM/3 format. The funny part of this story is that GEM/3 is downwards
compatible meaning that apps which support this format can load and display
pics coming from Xact and Xdraw correctly.

>Wrong. We DO interprete coloured GEM correctly - if coming from Xact.
Bravo !! but this is purely a matter of opinion...
Unfortunately except for some PD programs that generate it, it's of no real
use. If it wasn't for Gemgraph that is relatively new, there wouldn't even
be any apps around these days that support it.
The biggest drawback IMO of that format is that's it's very well suited for
tables and graphs but is hopeless for drawings which include filled polygons,
bezier curves... etc

>But we will go into contact with Christian Witt / Artworx, so maybe
>we can find a solution together, late spring.
Fine... better late then never. But like it or not, the real standard these
days on the Atari platform is CVG 1.1, perhaps you should get in touch with
Ulf Dunkel as well ?

>users from trying it.
Under normal conditions a newsgroup like comp.sys.atari.announce should be
THE source for news, that newsgroup is supposed to be there to give us
details about the latest updates, new releases, bugs, shows etc...
Unfortunately the newsgroup is moderated by someone that is either a moron
or simply hasn't got a clue what the Atari community is all about. For some
reason *only* known to that person, most announcements never make it, but
get thrown out...
DDP has tried a couple of times to announce new translations in there but
these postings never made it. Have you ever tried announcing an update of
your OVL in that newsgroup?

Does anyone here knows who the moderator is?
If by chance that person is reading this, would he be so kind to comment
on this?

Cheers from Belgium

Spot on... but without doubt ASH is working on it.

>Are the patches on the ASH site usable with the most recent English
>translation of the MagiCMac?
Sadly no... :-(
The most recent English translation is nearly two years old...

>or only with the German version?
Yes, meaning MagiC 6.10, as Shiuming pointed out these are service packs.
(I couldn't come up with the correct phrasing so I wrote "patches")

>Thanks again for any help on this.
Here's some more... :-)

The German MagiCMac version is obviously in German and comes with German
docs, however you can download the English RSC files for MagiCdesk from
Derrycks website (see sig),or even better buy Jinnee (the ideal combination).

When using an English desktop, German error output will be minimal, you'll
also need to install an English/American keyboard driver in the Extension
folder of MagiC.

If you are thinking of ordering the German version, buy straight from ASH
and explain them the situation, chances are very good they'll let you have
it for the upgrade price, don't forget to mention you've got an iMac meaning
they'll have to send you MagiCMac on a CD or simply by email, since disks
are of no use to you...

FamilyNet Newsgate

Hello!

GS> Essentially, "Real Mode" comes from the 8086 CPU's way
> of overcoming the 64k addressing limit of its
> predecessor 8080. (8085 also springs to mind, but I've
> never seen it up close so I cannot comment)

The 8086 and 8088, which was used in the original IBM PC and PC/XT bore a marked resemblance to their 8-bit predecessors. From an electrical point of view they were like the 8085 in that they had a multiplexed address/data bus. The 8088 was especially like the 8085, because it had an 8-bit external data bus... It was probably designed to make use of existing 8085 peripheral chips.

GS> Intel chose to have 64k segments, each of 64k bytes.

From memory, they had four segments, each of 64Kb: Code, Stack, Data and Extra segments.

GS> This would theoretically have given them 4 Gigs of RAM
> if the segments were placed end-to-end, but Intel
> decided to space them starting at paragraph (16 byte)
> intervals. So, you have 64k times 16 equals 1 Meg

Not quite. Allegedly to help people port the bulk of existing business software from CP/M-80, the 8086 (& co) had a 16-bit instruction pointer. The segment registers were also 16-bits wide, but were conceptually shifted up 4 bits and to provide a 'base address' (base in more ways than one come to think of it). The instruction pointer (and other registers) was an offset into the selected segment...

```
CS: 0001 0001 0111 0110 11760h
+IP: 0000 0001 0000 0100 + 0104h
----------------------- ------
0001 0001 1000 0110 0100 11864h
```

..whether you consider this an ingenious way of wringing a 16-bit chip from an 8-bit architecture or an ugly cludge that ruined the computer industry for years, hopefully you would agree that it's not an environment conducive to emulating a 68000.

GS> There was no way to protect one part of memory being
> overwritten by any app.

Not normally.

GS> So, to address a byte at address 512k (00080000 hex),
> you could use (in hexadecimal) addresses 8000:0 (512k
> + 0)...

Right, and the reason they're written as two separate 16-bit words like that (8000:0000) is because that is how you had to load it, into two separate 16-bit registers.

GS> ...with the first part being in a segment register,
> and the second half being in an index register.

Not really. Registers like the Instruction Pointer and Stack Pointer look a bit like index registers because they're offsets into a segment, but the 8086 had specific index registers SI and DI (source & destination index registers respectively). These too were 16-bit offsets into a segment (usually DS, the Data Segment I think).

GS> Similar ideology went into the 80386, with offsets
> from each selctor finally growing to 32 bits, along
> with data register sizes (selectors remained 16 bits,
> though).

I've written a whole article about the 386. It's interesting to note that it took until 1985 for Intel to come up with something that could realistically be compared to the 68000 (although in 1985 it had a 32-bit address bus). It was the first Intel x86 chip where you could (by loading a minimal descripter table) have a flat, 32-bit address space.

GS> The difference in ideology between real and protected
> mode meant that a real mode OS or application couldn't
> work in protected mode, and vice versa

One of the things you can do on the 386 is set up a task with a 'virtual 8086' flag. Although the processor is in protected mode, the process can be blissfully unaware that it's running on a 32-bit chip.

We've probably gone into more detail than people here in an Atari group wanted, but my thoughts are pretty much that I wouldn't want to try emulating an ST in real mode because it is so horribly limited. I'm guessing TOSbox and other 'DOS emulators' use a 'DOS extender' to spend much of their life in protected mode.

Regards,
- Andy.

>puzzled?

I get the same thing on my Hades during the memory test after I installed some extra Ram. Actually, I only get one X and 32 dashes. You may want to take out the board and re-install it. I was getting alot of X's, so I took out all the chips and re-installed them. I still get the one X and will try to get rid of it, but for now thing are going fine for me.

Is this an ethernet card for the cartridge port of a regular ST? Does it have
10Base-T (RJ45) or 10Base-2 (BNC) connectors?

It sounds as though I was barking up the wrong tree then. Hopefully someone else's suggestion will help, the mono- detect idea sounded promising.

Good luck,

I think we had a bunch of those at a university I once worked for. Was the IIci an upgraded IIcx?

GB> The game FA-18 Hornet on the Mac supported three
> monitors to give you a peripheral vision view outside
> of the cockpit.

That's swish!

I'm guessing the ST's system software only supports a single display at any given time. I don't know whether there would be any interest in multiple displays on the Atari platform.

Regards,
- Andy.

From: mb@gem.win.co.nz
Message-ID: <G8ICnA.2J@gem.win.co.nz>
Source record: 50305

Just a quick note to clear up a few things.

I have received a large amount of mail about the graphics card and I still have a number of messages that I have not had time to respond to yet. I will respond to them all eventually, but if you think I have missed your message feel free to email me again.

I hope I never mentioned a time of 1 month for the network version of the card, since that is not feasible. I have mentioned that I would hope to have the network support available in the first half of 2001 but no guarantees.

As it happens I have been extremely busy and not able to do any work on the card since this year. However at this moment I am beginning to make a little bit of progress again, fixing a couple of minor issues with the driver and getting some more boards assembled. I hope to start answering some mail in the next week or so.

Regarding memory, the card normally has 4 megabytes of video RAM. A 16 megabyte version is available, but in normal use the extra RAM is not really useful. In future it could be used by the accelerated driver for bitmap/font caching or similar, but this is not currently implemented. So the 16 megabyte card is currently only useful for developers.

Actually, there is a use for the extra RAM since any part of the card's memory could be used as extra system memory. However, it is much slower than the TT's regular RAM (but probably similar in speed to the Mega STE's existing RAM).

Genie sent out Notice that they would end their Dial-Up Service on February 4, 2001 and said to get a new ISP.

On Friday Feb. 2, 01 they sent a new Notice saying to disregard the other Notices, they would be keeping the Dial-Up Service into the indefinite future. They sent a list of new Phone Number to access this changed Service, which will connect but not link-up, "So no access"

Does anyone know what is going on with Genie ??

Thanks, Donner......

Hi,
Thanks for your email
Ok, I let the machine cool, reboot, It boots up properly.
(with the ------ not the XXXX)
The only thing I notice is a shorter black bar moving from left to
right. This is a wbsystemtechnik RAM board.
It runs for a while, then the screen looks like hell.
I can best describe it as short vertical dashes.
Everything seems to freeze at this point.
I try to reset, then the drive light comes on and goes off.
(repeatedly) with a sound.
I can't get back in at this point.
It is as if the machine reaches a certain temperature
then crashes. (I do have a small external fan to cool)

==========

==========

Ok, this RAM board.
I had a very hard time getting it in. And I was extra carefull.
Once the pins were aligned and I started to push down
It would not go down easily. It took a lot more pressure than
I felt comfortable applying.

It wasn't a perfect fit. Some pins were still showing on the
right of the board (the drive side)
The directions say that no pins should show.
I could not get it down any further.

Well now I can't even get it off. That's how tight it is.
Most of it comes off except for the right side.
I can't get it. And I don't want to use excessive pull.

The Atari board slipped off no problem!

So I tried adjusting it. Put it back together, booted
with the same problem.

This sounds like some bogus RAM. But I am not sure.
I asked for a 1x72 pin module, Specifically,
and got a 4x32.
But I was willing to live with that and forget the accelerator board.

But now I may not even have a Falcon.
This machine is more trouble than its worth.
I want to work with it. Not solve a bunch of technical problems.

thanks for your suggestion
ken

2136. Help: how to use TIH files on non-ST system

Newsgroup: comp.sys.atari.st
Date: 2001-02-11 19:41:34 UTC
From: James Wallis <james@erstwhile.demon.co.uk>
Message-ID: <UEwT3$Curuh6EwbH@erstwhile.demon.co.uk>
Source record: 50313

I need help.

I've recently been given around 300 Falcon floppies dating from the mid-90s, containing a lot of text and graphics that I really need. The text is no problem, but all the graphics files are TIHs. "It's just like TIFF," I was told by the guy who gave me the disks. "Anything that can display TIFF can display TIH."

Well, bollocks, as I'm sure you know. What's more, I can't find anything more than mentions-in-passing of the TIH graphics format on the web or the Deja archives. So I'm coming to the source of all wisdom on such things, my cap in my hand.

The trouble is, I don't have an ST. I'm reading these disks on a PC, and I need the graphics in a format that either a PC or Mac can read. TIFF would be nice. EPS, PIC, PCX or GIF are all acceptable.

So -- what are my options? Does anyone in the UK offer this kind of service commercially? (Sadly we're on a budget for this.) Is there software available which can convert TIH files, either PC-native, or running under an ST-emulator? For that matter, is there ST software that can convert TIH files to a cross-platform standard format? If so, is my only hope to find an ST running this software? Or have I missed an option?

Any and all help would be very greatly appreciated.

Is this the original type Atari 14mb board? Is it new? Have you
tried it in another Falcon if possible? The card could be dead. Do
you have an accelerator, other upgrades? I need to know!

which means they are not SCSI-compatible anymore, due to excessive stub
length.

BTW: AFAIK, no 2.5" SCSI disks are produced since quite some time now. If
you re-case the machine, it might come handy for an internel 3.5" SCSI disk.

>They made some improvements to the S/N factor and the standard
>clock patch for Cubase Audio to run flawlessly...

As I said: AFIK, those were the same mods that Atari handed as instructions
to their dealers. Even with these mods, the falcon sound system still lacks
a lot compared to a good external codec box.

Hello again,

I managed to get the RAM board off without any damage, I think.
I examined the board underneath.
There are two female connectors. One is 30 pin,
The other is 50 pin.
My apologies, I don't know technical terms.

Each pin on the 50 has a bannana like two prong connector.
One of the pins has only one prong and not two like the rest.
I suspect this is my problem.
A faulty RAM board.

I passed this site on to a PC friend he checked it and was amazed at the enthusiasm shown there for the Atari, something lacking in the PC world he felt. Not having a PC I wouldn't know.

Not it is not. It is new from wbsystemtechnik.
I do not have another Falcon. No accellerator.
Pretty much of a stock Falcon. I recently installed a 2gig IDE in it
and use HDDriver. It has been working very well with 4 meg.

I did get the board out and examined the female connectors.
One pin looks defective. 1 prong instead of 2 like the rest.

Source record: 50390

Hi Lyndon,

LA>So is there any other drivers that'll work, or do I go back and tell
LA>him to FO?
I had the same problem 2 years ago, when the power supply of my
Paragon MFS-600 CX suddenly gave up.

I brought the scanner to a small shop (PC only, of course) and the
gentle man sold me a MUSTEK 12000 (Scan Express, IIRC) but was ready
to take it back, if it would not work with my TT. So he did, for the
scanner was indeed recognized as scanner by NovaScan, but did not work
at all.

Finally, I bought the same scanner (used) for 80 DM (~24 Pd Sterling),
included an active SCSI terminator and cable...

When the power supply had been repaired too (80 DM as well), I got my
scanner back and now own two of them.

The 12000 will definitely not work with any Atari driver. Please do
prove me wrong!

LA>or do I go back and tell him to FO?
Yes, do so and tell him to become happy with windows!

Und TTschï¿½

Have you tried putting the Atari board back in? I'm not familiar with your board. Maybe it needs a new simm? Seems very odd that it's so tight to fit. The connectors are standard so it seems the spacing is wrong between the two connectors. How far out is it? With all that pressure you may have broken a track.

>according to the author, Dr Uwe ..., the limit is 256 MB.

Hi Peter S!

Not according to the Help text for Partitioning Limits in HDDRIVER 8.
That says: TOS 1.00-1.02: 256 MByte
TOS 1.04-3.0x: 512 MByte
TOS 4.0x: 1 GByte
MagiC, MiNT: 1 GByte, 2 GByte if DOS compatible.

And the original questioner had 1.04.

Why not use Look'n See or ST-Guide as a viewer, which both print?

But actually 1stGuide can print indirectly, as indicated in its Help
window (shown when clicking in a 1st-Guide window): Use ^X to write an
*.OUT file which can then be printed from the desktop, or via IdeaList
or even Everest. Don't forget to delete the OUT file later!

As I said in another message, I have installed Look'n See which makes an
excellent system-wide viewer that copes with almost any filetype (text,
image, binary), prints, and even processes files.

BTW, how do you get 1stGuide to print images? Mine only offers an option
to save as XIMG, but not print. Also seems to load only IMG files, not
GIF, TARGA, TIFF etc. which show only as text.

You need more than a cable - you need a host adapter from the ACSI socket on the ST to SCSI. ICD's Link2 is no longer made but you may be able to get a used one. Note that it needs term-power to be supplied by the SCSI device - most do, but a few don't. Alternatively, there is the Link98(?) from Woller Systeme in Germany.

>-rw-rw-r-- 1 ftp 3928 Apr 3 2000 gemgs13-upd.lzh
>
>You need all the above packages.

If he wants to save time, I don't think that -fnt2.lzh is required. I'm
not sure *what* it's for. According to the README in GEMGS V1.2:

fonts-2.lzh The fonts. In my opinion one only needs the *.pfb
from fonts-1.lzh. I don't know what the *.afm
and *.pfm (fonts-2.lzh) are there for.

but this is no longer there in V1.3.

>Although not so fast it's very handy to have it.

It *is* rather slow; if only it didn't have to reload the fonts for each
page, it would be much faster. The other problem is that I can't always
get the 'go to page x' to work. A particular problem if one page doesn't
want to print - you have to start from the beginning and probably find
it falls over at the same page again :-(

It sounds like the TV is off-tune. Try tweaking the tuning manually if necessary until you get a good image. Of course if it has a SCART socket, then a video connection to that would give much better results.

They didn't connect more than one cable to the chip itself if I remember correctly. The rest of the connection is to where the termination resistor packs were located from the start.
The only thing you have to do to get it back to standard, is to remove the extra board by the SCSI-port and solder three SCSI-termination resistor packs in it's place. If you just remove the internal SCSI-drive, you'll get termination problems.

C-lab never made any modifications of their own. The PCB is exactly the same as Ataris original. In fact, the "big changes" were made even when Atari sold their last machines and are the same that are described in the CAF user's manual (which BTW won't give you the -10dB standard...). One of the CPU-clock modifications was also made - but I've had to exchange to another modification on some C-lab boards, so it seems they decided to do the same on all of them - without testing them with CAF before they were shipped!
Check out the correct audio and CPU-clock modifications on my website - the troubleshooting section.

For USD300, you should be able to get another, used Falcon instead - and some extra stuff to go with it... It seems like a very high cost for repairing it.
Harddisk crashing? Sounds like bad termination or CPU-clock problem if you ask me. I know that the C-lab machines had a CPU-clock modification, but I've had to exchange that modification on some C-labs to make them work properly, so this may still be a problem :(
I've recently seen a really strange problem when trying to use a Conner harddrive together with a Yamaha burner - while both worked perfectly alone - and together with other brands of harddisk or CD-burner. Same thing on another Falcon with the same combination. The harddisk/burner combination worked ok on a PC but when booting, the SCSI-card stopped unusually long at the HD's address (but only when both the HD and the burner were connected and not with only the HD...). Strange problem indeed - and I must admit that I wasn't able to sort it out even though I've worked professionally repairing those and other computers for several years. Maybe this could be similar to the problem with your machine?

No Problem John. We all make mistakes even phantoms! :)

I highly recommend Apex Media if you have a Falcon and have a interest in
graphics and animation. It's one of the best you'll ever find for the Falcon.
Rainbow MultiMedia is another fine Falcon only graphics studio.

On the subject of Apex Media, Does anyone in the USA/Canada have version
2.40???

2170. Atari: Some various questions

Newsgroup: comp.sys.atari.st
Date: 2001-02-12 03:28:36 UTC
From: phantomm@eastky.net
Message-ID: <967l94$gd5$2@nd.eastky.net>
Source record: 50351

Got a few questions...

1. When using NVDI 5.01 and the NVDI Printer CPX, can the standard Atari Printer CPX be removed without problems on ST thru Falcon?

2. What is the latest version of AFTP and is it still being updated? Is it on a Web site, I don't see it where it normally was.

3. Has CENTEK released the ENGLISH versions of the CT2B FLASH 1.41 and any other CT2B updated software?

4. What happened to FVDI?

5. On a CT2B Falcon using NVDI 5.01, should one use GEMDOS.TXT, TOS COMPATIBILITY, and LINE-A in the NVDI 5.01 Compatibility CPX?

phantomm@eastky.net

2171. What kind of Atari CDs would you like?

Newsgroup: comp.sys.atari.st

I'd like to take a Atari CD Poll for everyone that follows CSAST.

What would you like to have in a new Atari CD that you would actually purchase?

Please E-Mail your answer to me at phantomm@eastky.net

The number of replies could determine what some new Atari CDs will contain. We would like your input!

Thanks for your help.

I'm going to do it through various nefarious means.. it'll take a
lot of development work, but I'll get there. How I do it depends on how
much information I can find about the ST BIOS, or if any of the emulator
authors can help out by giving my info or sources.. I'm working on a TOS
emulator for running a telnet server..

>

Hi,
Yes, I now have the Atari 4 meg RAM board back in.
Everything is working just fine.
I bought the board new, with 4x32 simm module new.
(Though I ordered 1x72 simm module)
The connectors are not standard.
For the 30 pin connector, they are rectangular, similar to Atari.
For the 50 pin connector, they are two prong "banana" shape.
These are the ones that are tight.
Broken a track on RAM board or on Atari?
One pin does look odd on the Atari. I looked at it close up with a
magnifying glass. It seems to have an irregular shape.
I did not see this as I was putting the RAM in.
It may have caused damage to the RAM board, Or vice a versa.
(If the prong was bad on the RAM board, it may have damaged my
pin in the Atari)
On the RAM board, it looks as if some of the housing around
those pins has been broken.
I didn't break it, thats how it was when I put it in.

Well my system is up an running with no crashes.
But unfortunately with only 4 meg.
This is definetly not what I intended.

thanks for your email.

Another site to try is www.planetquake.com although if id's site is
banned, that one probably will be too.

Although they've moved on to Quake III, they may still have the
original Quake demo files in their basement somewhere.

Also, try www.downloads.com part of the C-NET group, or the
ZiffDavis sites, www.zdnet.com

As for version, I think there was only the one demo, it should be
identified as such... come to think of it, there WAS an "alpha" demo
version that was released waaaayy early before the final release, but
I doubt that one will be still floating on those download sites.

Four Segment _registers_

(This is more a viewpoint issue - each seg register can hold a 16 bit
number, so it can be said that there's 64k number of segments)

That is the joy of USENET news. There are numerous things that
can cause this to happen. I have 2 news servers that I use. They both
get slightly different news. Although one is much better than the other.
As I said it can be any number of things that cause them not to get to
you. One is distribution flags. Some servers limit distributions, others
do not, some clients even limit distribution. If everyone had really nice
clients it would be very useful since we could do things like sell
equipment we want to limit to a local country and only have the news
distributed to that country. In practice it doens't really work though.

You also might see the original message pop up later. I will get
messages where the re comes in before the post it answers.

A generic simple explanation is as follows.

TAR was designed for Tape Backups. It compresses files or a range of
files into a single file.

GZIP is a compression tool for files or archives. It simple compresses
the data.

So both can be used in conjunction and create a smaller file.

I use serial 2 on my TT all the time with STiK2. So that
shouldn't be the problem. When Qdialer first starts up it shows Modem 1,
as it hasn't been told otherwise yet. Once it reads the Dial script for
your ISP it should switch the info that is displayed.

Sounds like you have some strange problem going on. What version
of Hsmodem are you using?

GS> Four Segment _registers_

Yes, for four segments!

GS> (This is more a viewpoint issue - each seg register
> can hold a 16 bit number, so it can be said that
> there's 64k number of segments)

No it can't, because the value of the segment register is
shifted up by four bits, the segment register points to a
'paragraph' of 16 bytes of memory. It sounds as though you
are confusing segments with paragraphs.

It IS good, yes, but takes a little longer to load than 1stGuide. Not much in
it really I guess.

>BTW, how do you get 1stGuide to print images? Mine only offers an option
>to save as XIMG, but not print. Also seems to load only IMG files, not

That's quite easy, once you've got a file opened for viewing press [CTRL]-A
to get to the Options menu. At top left you can choose to direct output to
Window or Device. Device Parameters... allows entering a GDOS device number
as well as some options for scaling, print positioning etc.

>

No. Actually, IIcx is not as good as the IIci. One of the problems that plague some of the II series was non-32bit clean ROMs. The story is long and I don't remember all the details about. But the bottom line is if you have a II, IIx, or a IIcx you need to have an extension loaded on the computer called Mode 32. This fixed problem code found in the ROMs of those machines.

The IIci has 32bit clean ROMs in it. It also has a cache slot, on board video, 4 simm slots, and 3 Nubus slots. The II required special 4MB PAL simms to correct a problem with the memory refresh signals.

Bottom line is that the IIci is the best all-around II series model. And can be picked up fairly cheap now. I've been seeing them appear in thrift shops now.

I don't know enough about the ST's to comment on this. But with the few models that do have the ability to add cards or other devices to them, I don't think this would be possible on the ST.

Apple did build this feature into their Mac's and Mac OS back in the late '80s. It hasn't appear on PC's until the late '90s.

>32. This fixed problem code found in the ROMs of those machines.

The IIci is also 25MHz, I think the IIcx is 16 or 20MHz.

(Generally, the IIcx is a IIx with only one floppy drive bay and three
NuBus slots).

>Bottom line is that the IIci is the best all-around II series model. And can
>be picked up fairly cheap now. I've been seeing them appear in thrift shops

I still think the IIfx would have been a wonderful machine, had they
written an optimised MacOS for it.

And the best 030 Mac?
SE/30 ;)

The Macintosh could support multiple displays via QuickDraw since the
very first 128... Witness the many additional graphics cards designed to
hang off the back of early Macs...

Yep, no problem. Ask elmar first of the status. Sometimes he had
problems to get ethernet adaptors.

> your message feel free to email me again.
Well, I was not really saying something interesting. It's just because you
put the "contact me" email adress in the "pricing" page... Since I'm
interested
in upgrading my MegaSTE with a brand new video card, I've just posted a
mail with the usual "price - speed - compatibility - bla bla" stuff :)

> I hope I never mentioned a time of 1 month for the network version of the
> card, since that is not feasible. I have mentioned that I would hope to
> have the network support available in the first half of 2001 but no
> guarantees.
Since I have the rom-port cartdrige lan card, I'm not interested by the
network
part of the card, but since this extension seems to be no more available, I
understand that a lot of people would be interested by this feature on your
card. (Is it supposed to be faster than my actual network card ?)

> As it happens I have been extremely busy and not able to do any work on
> the card since this year. However at this moment I am beginning to make a

Cool.

> Regarding memory, the card normally has 4 megabytes of video RAM. A 16
> megabyte version is available, but in normal use the extra RAM is not
> really useful. In future it could be used by the accelerated driver for
> bitmap/font caching or similar, but this is not currently implemented. So
> the 16 megabyte card is currently only useful for developers.
Someone told be that if I use huge resolutions on my MegaSTE (like the
1280x1024
in 16 bits) I will not have enough memory. I believe it is because some
memory
is required for the redraw management (like memorizing what is behind the
windows).

> Actually, there is a use for the extra RAM since any part of the card's
> memory could be used as extra system memory. However, it is much slower
> than the TT's regular RAM (but probably similar in speed to the Mega STE's
> existing RAM).

If you have more information about this specific point, it will be very interesting.
With higher resolution, and up to 16 megs (normal 4 + card 12 megs) it starts to
be interesting for me to install a multitasking os instead of normal TOS :)

Keep on doing the good work !

Mickael Pointier

PS: I'm still interested in knowing the evaluated price...

The AES allocates a buffer where it stores the background before it draws menus and modal dialogs. With the standard AES this buffer is 1/4 of the size of the screen, so with 1280x1024x16 it will "only" be around 650Kb. However, MagiC and N.AES use a much smarter method and can use much more or much less, so you're right - with only 4Mb it will be tight.

However, it's possible to have this buffer on the graphics card itself. I don't know if the current fVDI driver allows this, but I assume that it will in the future. The RageII-driver does this, and it speeds up background restores quite a lot.

TIHs were greyscale TIFFs, used by some Digital Arts programs such as
DA's Vector and DA's Layout and possibly some other propgrams. I have
the former but haven't ever used it, and certainly couldn't undertake
such a large-scale conversion. I find it hard to believe that they were
Atari-only, but it's possible.

>The trouble is, I don't have an ST. I'm reading these disks on a PC, and

I have to admit I have no idea about what speed I can expect from the
Galaxy card on my MegaSTE. Can I hope to have redraws that are
faster than a Falcon in 16 bits mode ?
The "fVDI" is drawing texts pixel per pixel, or does it uses blits for the
letters ? I know that the MegaSTE is running at 16mhz, so I wonder if
it is fast enough to use applications like texts editor with a decent speed.
(screen redraw time is scary in 640x200 on a standard ST without blitter).

When using a VME card, is it still possible to use the normal video
output ? I would like to be able to code demoes in ST Low res, or play
non gem games on the television, while using Gem interface on the
VGA monitor.

Thanks for the answers.

I've just been trying to view an Ariane space launch
on the Arianspace web site.

It was very frustrating. I am sure they had deliberately
buried the link under a load of javascript just to be
awkward. What would have been so bad about using an
ordinary html link?

I think Aniplayer will play some video feeds but
I've never managed to successfully play any due to
problems like this.

Are there any (suitable) sites that I could have a look at?

On a similar topic.

I had another look at the relocated Draconis site recently
and development is continuing. I have the Milan home
edition but I cannot get it to dial from my modem. Is it
a disabled feature ? If I could get it to work I might
buy it just to get the javascript support for these
awkward sites. I assume Draconis(LoA) supports Aniplayer.

I could never understand why ASH didn't get someone to
continue CAB development. IMO it is the best looking
browser by far. It renders pages far nicer than IE.

I don't know javascript but it doesn't look like a complicated
language so an interpreter wouldn't have been too difficult to
add into CAB.

Thank goodness that HighWire is being "released". Hopefully
we can all contribute something to its development.

I have never used this card, but I would be surprised if it wasn't atleast
5 to 10 times faster than a standard Falcon in 16 bit even on a MSTE. This
depends heavily on the driver though. The card has a "CPU" of its own that
does the hard work (blitting, lines, fills etc.), but I don't know to what
extent the current driver utilize this.

> The "fVDI" is drawing texts pixel per pixel, or does it uses blits for the

Again, I have never seen this card but I would be very surprised if it's
not significantly faster than any native Atari graphics chip.

Yes, and no, in that order.

Many thanks for the information about the files' nature. I don't know if
TIHs were definitely Atari-only, but none of the PC image programs or
file-converters I've tried has ever heard of them. And I've tried
several.

>Every emulator under DOS is slow compared to an emulator under Windows.

As matter of fact, yesterday I tried the last (free) release of Gemulator
for DOS (V3.8). Its docs explicitely say that it is a 32-bit application.
And it showed to be just a little bit slower (about 20%) than Gemulator 2000
(i.e. for Windows)- therefore much faster than other emulators on DOS
(i.e. about 3-4x faster than TOSBox).

In fact, it seems to be very compatible and could be quite good- about its
only, but fatal, drawback might be that it can use only 4 "disk-container"
files up to 32MB each- and thsis appears to be a commercial decision, so as not
to threaten the commercial Windows version. I tried TOS2.06, TOS2.06+Mint+AES4.1,
NVDI, end it works; the docs say it is supposed to run Magic as well.

Hi Peter,

I see that you use Newsie on your Milan. Until recently, Newsie used to lock up my Milan at 256 and above, every time I tried to do anything but view a mail. Now I find that it's fine in mono, I am using it now at 1024x768 in mono and everything works, including binary extraction. Have you found a way to use it with 256 or more colours?

I think both the pin and board are damaged.

> Remember that the Atari could still have a broken track even
> though the 4mb still works. Not all te adress lines are used on the
> 4mb board, that come into use on the 14Mb board.

wonderful. The pin on atari is not broken from topside.
It looks like it is splintered. But it does not separate.
I think the pin was initially defective. When I started to push
down, it crunched the prong in the board.
You really can't see the defective pin without the aid of a magnifying
glass.
The connectors on 14 meg board were a lot tighter than the 4 meg board.
On 4 meg they are rectangular in shape. On 14 meg 2 prong banana.

> Ask about or take it into an electronics shop and ask them to check
> continutity between all the pins to check every connection for dodgy
> pins etc. Do you know a friend that's handy with a multimeter?

That's a good idea. I know a guy at a computer salvage shop who
is familiar with Atari's. He had his own BBS with a TT.
I talked with him tonight. He said he can test the RAM and possibly
fix the pin on the RAM board.
But of course, it will cost me.

> Well return it then and get your money back and try getting one from
> another dealer.

I doubt it. It is an overseas order. Very slow response, if at all to
emails.
And I am sure he wants nothing to do with me. Not to mention the
language barrier.

Just money down the drain.

One other thing that came to mind.
If I ever get new RAM in, will I have to repartition my Hard Disks
with HDDriver?
Could this also have been a reason why it was crashing?

Hey, thanks a lot for your suggestions (and newsgroup)
Appreciate your postings.

ken

Hi Steve,
Memory or monitor? I did check monitor. This was on a reset, not coldboot.
I keep an "empty formatted" floppy in the drive. And use HDdriver.sys

The machine was booting up correctily. All my programs were accessible.
But then all of a sudden the screen gets qirky. Vertical dashes.
I then turn it off, let it cool down and try again.

When installing new RAM, do you have to repartition
hard drives and reinstall
HDdriver.sys?

> If its crashing with the media on you'l have to eliminate the faulty app
> on the relevant media, bypass the hard disk boot and disable all ACC's

If you really think he's not able to understand english I could
translate your mail to german but there are very few people in
Germany who really don't understand english.

> Just money down the drain.

Don't give up so easily. In my experience there is only one german
dealer where I had to give up and it's not that one.

> One other thing that came to mind.
> If I ever get new RAM in, will I have to repartition my Hard Disks

> Could this also have been a reason why it was crashing?

Definitely not. I started with 4MB, then had several 16MB boards,
the one I use at the moment is from Wizztronics, and now with
the CT2 I added 32MB of fast ram and the only time I had problems
similar to yours was when I had a bad solder on the motherboard.

Gerhard

>....but where exactly?

I think it's in the January issue - the title of the review didn't shout
"this is a review of an Ethernet ROM port card", so you might have to look
for it. Might have been "Connections" or similar.

There weren't any of these cards left when I looked on the web site a
couple of days ago BTW.

I meant to change this last paragraph before I posted.

[CTRL]-A takes you to the parameters page, but if you change direct output to
Device, _all_ output will go to the printer. Instead, after making sure that
you've set up your options under Device parameters, press [CTRL]-P when you've
got a 1stGuide window open with your desired image.

I'd hazard a guess that Imagecopy would read TIH files, it has conversion
possibilities to many output formats including BMP.

SInce this is an Atari program you'd have to run an emulator on your PC.

I was simply going to get one for my TT but I may get two if this could also boost my MegaSTE to 4Mb ST RAM (current) and 12Mb TT RAM then the machine would be a much more usable box.

I think if this was implemented and the unit was sold with this as a feature then many more MegaSTE users would purchase one, can you also fit a 32Mhz upgrade on there too?

Mark.

Hi Jorgen,

Could be that Newsie doesn't like Magic or needs the extra memory (I
only have 20Mg, faulty chip). It's no great loss working with B/W for
Newsie and aMail, as you know a quick reset to 16-bit colour for CAB
only takes seconds. Thanks for the info.

Bob.

Hi there,

We all need one good programm to send SMS messages to any GSM operator
in the world.
And this is possible to do.
There is one programm called 'Gadu-Gadu' (polish programm) to make such
things, but it's for PC...
Gadu-Gadu can send SMS to all countries located in Europe also to USA
and Canada !!!!
I've spoke to the authors and they said, they probably make (or they'll
help to make) Atari version!!! :))
What we have to do?
Just send an email to: tech@gadu-gadu.pl
Subject: Gadu-Gadu for Atari
Content: 'when the Atari version will be available?' or 'we want Atari
version of Gadu-Gadu' or something like that :)))

Hi Bob

Might be Magic, can't really comment on that. But it can't be memory,
on my machine, Newsie take's something like 600k. When I'm online and
have Mint, Naes, Taskbar, Sting, Newsie, Qed and a lot of small auto
progs, I'm nowear near 20MB. More like 7 or 8, so the best bet would
be Magic I should think, but Magic-users would have too tell you that.

You need to run getty or mgetty on the serial port you're going to use on
the Linux-box. I don't know how to do this under Linux, but it shouldn't
be hard to find documentation and/or HOWTOs for this.

Forget Adamas for the moment. The javascript support is just one big
joke. Even a very basic script will bring down the browser and
eventually the whole system. Furthermore the rendering is not very good
either.
I can't understand why one have to pay for a prg that even doesn't
deserve the name beta testversion.
>

Good God Man! IS IDt still using the GEnie mark? IS IDt still ALIVE??

As a longtime GEnie user (the real thing, not whatever is still out there) watching IDT buy it to leave it ferster and rot and then hanging in till the system plug was pulled, I couldn;t imagine use IDT for anything I neded to count on. WHat the heck are they still doing with the naem GENIE?

Hi Ken

>> I assume your rebooting with all floppy drives ejected and hard disks
>> powered off, if so, check the memory is securley connected.

>Memory or monitor?

Memory.

>I did check monitor. This was on a reset, not coldboot. I keep an "empty
>formatted" floppy in the drive. And use HDdriver.sys

In the absence of a problem with the memory expansion its possible that
your PSU is borderline, this would explain why it happens after a while.

Is it possible to direct a fan onto the PSU to see if this delays your
problem?.

Its also possible that a connector specific to the 14meg expansion is
faulty which would explain why the 4M kit is OK. So check and correct any

connector problems.

>When installing new RAM, do you have to repartition hard drives and
>reinstall HDdriver.sys?

Nope you dont have to do anything like this. YOu may have to set some
header flags if you installed TT ram but i think Falc expansions are all
ST ram

Do you know someone else with a Bird that could test it for you.

What version(s) of Newsie are you using? On both Geneva and Magic, Newsie
works perfectly up to version 0.94. Version 0.96 freezes on both Geneva and
Magic on my Falcon when I try to do certain tasks, especially openning menus
that have submenus in them. So I just went back to version 0.94 and
everything worked perfectly. Maybe this is the problem?

Is gz (GZIP) the same as normal ZIP of the Atari? If so, it too can
compress several folders/files into a single archive file. So what do
you gain from TARing it first?

2240. Strange HDDRIVER behaviour

Newsgroup: comp.sys.atari.st
Date: 2001-02-13 20:45:58 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <96c6e6$8rq$1@plutonium.compulink.co.uk>
Source record: 50219

I have noted somethinga little strange with HDDRIVER8 on my Falcon, which Dr.Uwe says he's never come across and can't duplicate. I wonder if anyone else has had this experience?

My Falcon boots from an internal IDE and has a SyQuest EZ-135 as ID1 and a Toshiba CD-ROM as ID2 on the SCSI bus. I only switch these latter two on at booting when they are likely to be needed, though both are permanently enabled in 'Devices and Partitions'. When the EZ-135 is switched on but the CD-ROM is switched off, the computer hangs when the 'Device check' dialog appears in HDDUTIL (called directly or via 'Auto configure'), and cannot be quit with ESC. If I switch off the SyQuest while the dialog is open, everything proceeds as normal, displaying the Falcon and IDE IDs. This does not happen when the CD-ROM is switched on, no matter whether the EZ-135 is switched on or off.

This only seems to happen in HDDUTIL - I can use the EZ-135 quite happily with the CD-ROM off or on.

I have no idea of the cause, and neither has Dr.Uwe :-(

Regards, /Peter/

From: mb@gem.win.co.nz
Message-ID: <G8prpE.Hs@gem.win.co.nz>
Source record: 50147

To answer a few more points:

Yes, I guess with 4 megabytes of system RAM memory would be quite tight. To be honest I have not really looked into these practical issues on the Mega STE, although the card will work. On the Mega STE the amount of VMEbus address space is very limited; I can't remember off hand how small it is, but it does severely limit the use of the extra RAM as system RAM.

Regarding speed; the current driver is not very fast, although quite usable on a TT. The card has the capability to be extremely fast - faster, I expect, than any other Atari graphics card and certainly vastly faster than any Atari builtin graphics hardware, even when used on a Mega STE. Writing the firmware and driver code to actually take advantage of this possibility will take a while. But work is progressing.

I'm looking for a Falcon, but they seem harder to come by than I would have thought. I'd ideally like a Falcon and some accessories .. like a memory board and the cables/connectors to hook up a VGA/SVGA monitor (since god knows where you'd find a Falcon monitor... (will it work with Atari ST colour monitors?)

What sort of accessories should one have for a Falcon? (I never had one.. just the ST series and a portfolio)

jeff

Hmm, that's interesting. I tried everyting on mine. Termination,
cables, the lot. Good old HDDriver picked it up first time under ID
check, so I am thinking chances are it's not a physical problem with
SCSI etc.

Having a device on the scsi or ide bus that is switched of while other
device's are enabled can cause problem's for 2 reason's,

A: The device order and termination, i.e. is the cdrom's termination enabled
or is the scsi chain terminated via a physical terminator at the end of the
chain. If the CDROM is terminated you may get weird termination result's,
causing the bus to hang. Are they terminated at all?

B: The precence of a device on the bus can apply a load to the Bus and also
cause it lock up because the busses resistance will change to a non-usable
value.

When the EZ-135 is
> switched on but the CD-ROM is switched off, the computer hangs when the

> happily with the CD-ROM off or on.

Also you don't need hddriver to scan the SCSI bus for the CDrom, in my
experience this is only neccesary when using an IDE cdrom. Realistically you
should never switch any device's on the SCSI bus off, the only other option
is to physically unplug them. It does depend alot on the device being used,
but PC's suffer from the same problem. If an IDE drive is attached to a
PC/Atari and the device has no power the machine will go AWOL. SCSI is
better than IDE but not perfect;-)

Mark

Try changing the "experimental" line in Newsie's prefs inf file to:

experimental = NNNNNNNNNN

John Rojewski suggested this when difficulties with 0.96 were reported.
I have had no problems with it ever since.

Cheers

Paul

According to Mark S Baines' "Atari A-Z",
TIH is a Retouche TIF haltone image; Retouche is, I surmise, an image
editing app for the ST. Likewise, TIM is monochrome and TIP is
palette-colour.

I can't help with your other requests, James, sorry.

Charles.

Hi, Dan. Would you confirm that QDial's config file is called
"Default.cfg" (QDial.cfg is mentioned in STiK2b's Install.txt)?
I ask because the serial port is named there, but QD is not reading it.
(It is in the Stik_cfg folder.)

I conclude from your words that the Modem button should just be left
alone (I was trying to change it: that's when I got the infamous 68000
error and two bombs).

> Sounds like you have some strange problem going on.

Hi Mike,

you have hit the nail on the noggin. I was using 0.96 and 0.94 works fine in
full colour. Has the author been informed. Thanks again.

2257. FS: 1040STf system in Salt Lake City

Newsgroup: comp.sys.atari.st
Date: 2001-02-14 01:46:46 UTC
From: Tom Rosso <audio*nospam*philia@qwest.net>
Message-ID: <3pli6.1658$RG5.640970@news.uswest.net>
Source record: 50236

Hello,
I'm afraid that I must part with my 1040ST system. It just doesn't get the use that I know it deserves. Everything works great. Here's what it is:
Atari 1040ST w/internal DSDD floppy drive
Atari SC1224 color monitor
Atari SF354 single-sided floppy drive
Atari STM1 mouse (and it works perfectly!!!)
a Wang 14.4k external modem.
I have all of the cords to hook everything together, plus I'll throw in a bunch of game disks that I have. They're all copies, nothing really original. Just stuff I got off of the Little Green Desktop website.
If you're in the Salt Lake City, Utah area and are interested, send me an email at audiophilia@qwest.net and make me an offer for it all. I'd rather not ebay it because I don't want to deal with packaging it all up and shipping it. Thanks.
-Tom Rosso

Hello Janka Gerhard,

Thank you very much for the offer.
I am not quite sure how to handle this. Maybe I should call.

Today I took my RAM card to a local electronics shop.
I know what is wrong with it.
There is a 50-pin female connector. It comes off. Like a header.
I need that part, (because one of the pins is "crunched")
but with box like conductors instead of prongs.
The 30-pin female connector on the same card has box like conductors.
This would allow extra space for the "oversized" pin on the Atari.

The problem is, is that when I email the dealer I get no response.

> Don't give up so easily. In my experience there is only one german
> dealer where I had to give up and it's not that one.

Thanks for the encouragement.

Hello Richard,

I couldn't get back in once I rebooted. I would have to power
everything down, let the machine cool off or whatever,
then try again. It boots fine (the only thing I noticed that was
slightly different was the black bar that moves from right to left.
That was much shorter as compared with my old ram.

But I'm 99 percent sure I know what is wrong.

I have an irregular male pin on the Atari board.
It is real hard to see and I did not look at it close up before
I installed the board.
When I set the board over the pins and began to push down,
it "crunched" one of the conductors on the RAM board.

Today I had it at the shop, and that whole part comes off like
a header. All I really need is that replacement part.
(with box-like conductors instead of prongs.)
The technician saw no other visible damage to the board.

Hi Lyndon,
I took the RAM board to a different electronic shop today.
He had loaned out his RAM tester, so It was not possible to test.
The technician exaimed the board and saw the bad pin that I was
talking about.
The whole part comes off. Like a header.
He suggested I contact the dealer for that specific part.
That is the only thing he saw wrong with the board.
(atleast visibly)
He didn't charge me anything for the exam.
The problem is that the dealer hasn't responded to any of my emails.

2262. WTB - part for WB Systemtechnik GmbH Falcon RAM board

Newsgroup: comp.sys.atari.st
Date: 2001-02-14 04:17:52 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a8a06f1$0$70811$272ea4a1@news.execpc.com>
Source record: 50242

Hello,

I recently purchased a new 14 meg RAM board for Atari Falcon 030.
Due to a set of unfortunate circumstances, the board has been
damaged. Either by me, or possibly in shipping. Not sure.

There are two female conncectors on the board.
a 50pin and a 30pin
Inside the 30pin are "box-like" conductors
Inside the 50pin are "prong-like" conductors
(you can see when you turn the board over and look into the connectors.)

I need the 50pin with "box-like" yes "box-like" conductors.
I have an irregular male pin in the Atari. "prong-like" will not work.

The 50pin comes off like a header. All you need is a screwdriver and
a gentle touch.

Best electronics does not have the part.

WB Systemtechnik has not been responding to my emails.
I don't know why.
Though at first upset about it, I am certainly not blaming them.

If you have such a part for sale,
please respond to:

kjcat@execpc.com

thank you

ken

>(It is in the Stik_cfg folder.)

Boy do my docs stink ;)

Here is a quick answer (too late at night to stay awake for a
long one)

DEFAULT.CFG is STiKs configuration file. It is loaded at boot.
QDIAL.CFG is Qdialers configuration file, but it is generated by Qdialer
and shouldn't be necessary for the user to edit.

If you have your serial port defined in DEFAULT.CFG, then it
should appear when you launch Qdialer. However if it does not then it can
mean one of a couple things.

1. SERIALPORT - is misspelled or has a # in front of it

2. The value for SERIALPORT is not a correct value (mispelled, incorrect
or non existant port name)

In either of these cases it will default out to a different port.

What do you have your port name defined as?

>
>I conclude from your words that the Modem button should just be left
>alone (I was trying to change it: that's when I got the infamous 68000
>error and two bombs).

That's strange. Nothing should happen when you hit that button.
Doesn't do anything here at least. I wonder which RSC you are using? The
color or the mono? I generally use the mono rsc, so it's possible there
is a problem with the color rsc file.

>
>> Sounds like you have some strange problem going on.
>>What version of Hsmodem are you using?
>
>It's HSModem 7.
>

Time flies. I think I'm using 5, I might have upgraded to 6. I
can't remember anymore.

If the problem really is only the connector you maybe should try
to get it at a local electronics shop. I think that would be not only
faster, but probably cheaper than the phone call to Germany.

Hello Bill!

BF> Has anyone here done a null modem transfer of files
> from a TT to a Mac?

I've never tried that particular combination, but it should be fairly straight-forward.

BF> Just wondering what terminal programs I should use. I
> have Flash, and others, for the TT, but have no idea
> what to use on the Mac for a terminal program.

I'm not familiar with Flash, but the most simple way is probably to run a terminal program that supports a serial file transfer protocol like XModem, ZModem or Kermit. It shouldn't matter whether you run the same software at both ends, so long as they can agree on a protocol. XModem is far from optimal, but is very widely supported and simple enough for most programmers to get right.

Many Macs have been supplied with Claris Works or Apple Works (different names for essentially the same product) and this should suffice for the Mac end. I forget what terminal software I used to use on the ST end, hopefully someone here will be able to suggest something appropriate. If you're using the TT's LAN port, it shares the same pinout as a Macintosh, so a regular Mac printer cable should do the job. Set both ends to 8 data bits, no parity, 1 stop bit and hardware handshaking. Make your first few tests at 9,600 BpS. Depending on various factors you may be able to increase the speed of the link, but as the Kermit people used to say "First make it work, then make it fast."

Let us know what Mac you use, whether you use LocalTalk and what serial port you plan to use on the TT.

Regards,
- Andy.

<cut>

I'm not sure if this want Mark was trying to say in part A or not but as
opposed to a straight wire like through connection, the connectors in one or
both units might be buffered and so having the device turned off will
prevent through commumication as there is no power the the buffer chip.
If the CD ROM is the first device physically connected in the chain this
could be the probelm, try changing them around and see if this makes a
difference, if you use the EZ-135 more than the CD ROM it would make sense
to have it a s the fist physically connected anyway, otherwise you will just
have to turn both devices on.

If the SCSI bus is properly set up, a switched off device will not cause
any problems. The SCSI standard explicitly allows devices in the SCSI
chain to remain switched off. Note that this does not apply to IDE
devices.

> Also you don't need hddriver to scan the SCSI bus for the CDrom, in my

With regard to SCSI it does not make any difference whether you own an
Atari or a PC: SCSI devices may remain switched off and the standard
allows this.

Depends on the CDROM driver. If you use Spin! you must activate the CDROM's
ID in HTUtility because Spin! relies on using the SCSI driver thus activated.

Hi all,

I need to clear some space, so I have the following up for sale:

STFM is in Lighthouse Tower case. STFM has a Magnum/Aixit RAM card with 8MB SIMM (can go up to a 14MB to give 12MB or so) and TOS2.06 fitted. There's also an ATKEY PC keyboard interface (I'll throw the keyboard in), and a LinkII SCSI interface and 540MB hard drive. External Centronics connector for further devices, and there's even a Forget-Me ROM port clock with pass-through.

The monitor is a System Solutions SM14S one and has seen very little use.

I'd be looking for 50UKP for the ST and 25UKP for the monitor - you must add postage, or collect from Watford.

I don't want to split the ST or ship outside of the UK.

> (since god knows where you'd find a Falcon monitor... (will it work with
> Atari ST colour monitors?)
>
Hi Jeff,
A Falcon can work with Atari ST color monitors, and VGA monitors, but
you cannot display all resolutions on both. The only way to display all
standard falcon resolutions on a single monitor is to use a monitor that
can handle video frequencies as well as VGA frequencies (like some old
multisyncs).

Atari ST color monitors work in interlaced and overscanned mode and thus
are better for gaming/demo viewing, whereas VGA monitors work at higher
frequencies but cannot display true color images in the highest
resolution which isn't interlaced, this makes VGA monitors better suited
for "serious" applications.

You will need special connectors or cables to connect your Falcon to a
monitor, but you can also do them by yourself (Falcon video port pinout
is decribed in users manual and can be easily found on the net).
Eddy.

> being one.

I'm down near Portsmouth.

Here's what sent to Barrie:

Here's a list of the things I'd like to get fixed:

STFM 520 upgraded to 4 Mb (Rev C motherboard)
Falcon with Nemesis/14 Mb and Expose
SM125 mono monitor
AOC SVGA colour monitor

STFM 520;
This I was using to run Cubase up until the other week when I finally got round to swapping it with my 4 Mb STe. I thought I'd fix it up with an HD I'd been meaning to replace an old one and a spare monitor (the SM125). I had it working perfectly for a week when the monitor went blank. Luckily I had another SM124. Then the floppy drive started playing up, the Atari kept crashing when I was copying stuff to the HD. Then it stopped working all together, then keyboard stopped working, then the sound and now no picture. Of course when I took it all apart and had it in bits on the table it worked OK, put it back together and nothing. I'd always had problems with this machine, it only seemed to work without the top shielding so I left it off which didn't seem to make any difference this time. So it's basically dead apart from the power light. Sometimes if I start it up without the monitor connected the drive will go for about 5 secs then stop with the light still on. If I connect the monitor I get nothing. Also if I pressed down on the front part of the motherboard while it was working it crashed. I thought it might be something shorting out underneath but there's cardboard between the shielding and the motherboard. I had a look at the underside of the

board but couldn't see much wrong (not that I know what I'm looking for). Bit of a mystery. Only thing I can think of is the Yamaha chip as this controls everything that's gone wrong but I wouldn't know which one it was.

I thought maybe I could take the 4 Mb upgrade and put it in another 520 I've got but when I had a look I found all the chips were soldered in (it's a REV D motherboard) so that was no go.

Falcon;
This is basically dead too, only power light, no picture, no boot up. It's been flaky ever since the Nemesis was put in.

AOC;
This is the same model that Dave Encill used with his Falcon at shows so I know it's OK. Only the power light comes on (same as the 125) . If it's the transformer blown on these I understand it ain't work bothering to fix 'em?

Does Cubase v3 work on a Falcon 'cause I'd rather get that and the AOC working than the others. The 520/125 are only needed if what I'm using now packs up.

> the most often used floating point operations?

The older 68882 and 68881 FPUs only implemented these functions in hardware mainly in the sense that there were opcodes for trig and log functions. There wasn't any dedicated hardware for them; each time a trig or log instruction is executed, the 881 and 882 actually run a microcoded control program which performs a series approximation of the desired function, using the hardware multiplier, adder, and so forth to calculate and sum each term in the series (out to however many terms are deemed necessary).

The 881 and 882 needed microcoded trig and log because it cost too many cycles to communicate between the separate CPU and FPU chips for each FPU instruction. Microcoded trig and log allowed the CPU to send just one instruction to kick off a lengthy calculation, resulting in a big reduction in the amount of communication between the CPU and FPU.

With the 040 and 060, the tradeoffs are different: the limitations on feeding the FPU instructions quickly are gone, so it turns out that they suffer no performance penalty for not having microcoded trig and log instructions, given a sufficiently good library implementation of each function. Better yet, software libraries can be updated when some clever guy figures out a new optimization, which is a bit harder to do to microcode.

So the net result is that trig and log functions are still faster on the 040 and 060 (assuming good math libraries), just not by the same proportion that regular FP instructions are.

I use a very 'modern' 17" Multisync without problems. For ST Low the
Falcon video logic does the 'scan doubling' so games are no problem
from the monitor view. Only some demos working with overscan need an
RGB monitor.

The major difference is that the Apple 68K emulator is dynamic. It
keeps a 512KB cache of translated code sequences in RAM, and that's all
you get. FX!32's goal was to accumulate and store on disk translated
code for each program you run, until ultimately you're never running
anything but native Alpha code. (It was also supposed to use some
optimization techniques borrowed from compilers on the generated Alpha
machine code to improve performance.)

> to slap it silly when it comes to the GEMBench graphics speed numbers, if
> the above is anything to go by (MagiCMac might only make use of the
> hardware acceleration features for a few operations, like the scrolling).

Another limiting factor is QuickDraw, the MacOS graphics API. It is a
synchronous API (expects each command to complete before the next
begins), which is not nearly as suitable to hardware acceleration as
asynchronous APIs like GDI. You have to be able to queue up several
outstanding operations to get the maximum throughput out of modern
accelerator hardware, and QuickDraw's model is incompatible with that.

> I just bought an old PowerMac 7100/80 and will hopefully be able to run
> some tests on that within a week or two. I'd expect it to run emulated
> code at speeds similar to my AB040, but that remains to be seen.

The 7100/80 uses a simple jump table emulator. Each 16-bit 68K opcode
is used as an index into a 64 Kentry table, and each table entry is two
PowerPC instructions (fixed length of 8 bytes). If the handler for the
opcode is one PPC instruction, the first instruction is the handler and
the second is a jump back to the instruction fetch code. Otherwise, the
first instruction is a jump to the real handler.

This emulator is of course much slower than the later dynamic
recompilation emulator. As a result the original 6100/7100/8100
PowerMacs were generally slower than 040 Macs when running 68K Mac
software.

You're right. IIfx was a good machine. Had one drawback...those damn 68 pin simms. Made it hard and expensive to get RAM for.

Besides, a Daystar 50MHz PowerCache would make the IIci outrun the IIfx. The IIfx would have the advantage with it's 6 Nubus slots for larger expansion.

>
> And the best 030 Mac?
> SE/30 ;)

Hands down in the compact series!!!! IIci rules in the modular series.

Quadra 950 is the awesome monster machine in the 68k series.

Source record: 50260

Hi.

I would like to know what software I need to be able to use a
SCSI CD Rom on my MegaSTE.

I just got a 32x Plextor SCSI CD drive, and I would like to use
it on my MegaSTE that already has a 500mb external scsi
harddrive.

I never use CD's on an atari before, so I have no idea about what
I should use. I wonder if the driver I'm using for the harddrive
is able to work with that CD rom ?
Right now the driver is a german thing called "Hushi", and I have
no idea about how it works. I just got this MegaSTE installed
like this, it was working, and I never think about changing anything.

Should I change this driver ? Is it possible to have a driver in
english ? Is it possible to have better disk performances with some
other driver ? How can I listen music from the CD Rom ?

That's a lot of question, so thanks in advance for those that will
reply.

Dbug

PS: It looks like a lot of people here are using "HD Driver". Is it the
best one ? How much does it cost ? Is it possible to change driver
without losing informations I have on my harddrive ?

No, completely different, just as LZH and ARC are different

> If so, it too can
>compress several folders/files into a single archive file. So what do
>you gain from TARing it first?

By combining all the files into one file, the overall compression is
likely to be slightly better. This is because there may be bits of one
file that, while not very compressible on their own, may be repeated in
the other files and, therefore, may be slightly more compressible.

Hi Marshall,

ML>I had my 12000 working ok with my Falcon030 using NovaScan years ago.
ML>I never tried it on my TT.
that may be true without proving me wrong. My MFX 6000-CX is in fact a
600, but it's nicknamed 6000.

So the better version, 1200, may have been sold in the U.S. or
elsewhere under the name of 12000.

The scanner I mean was sold in Germany as a MUSTEK 12000 ScanExpress
recently, not years ago. And it definitely doesn't work at my TT.

So, you _and_ I might be right.

The SCSI ID being correctly recognized by HDDRUTIL won't help if the
scanner doesn't scan when being asked to do so.

Und TTschï¿½

>They'd charge a fortune though?

But you'd get a working and guaranteed job done, at the rate for the job.
It might be a hobbiest machine but it takes a skilled technician as much
time and effort to repair.

Besides...

They wouldnt cut holes in your case for access instead of taking it apart
properly, nor would they use cornflake boxes to insulate stuff, they also
wont send back a different machine, or steal parts of yours, or sell it
without your permission. As has happened to other people who go elswhere
for repairs.

I'm south of Bristol by 30 something miles. Bit of a long drive
really, isn't it?

STFM- sounds like a small problem that is caused by something shorting
as it's assembled. Chips, unlikely to have blown. Stop turning it
on overwise they will be!

Falcon - Ouch, seems more like a blown chip. Don't have the facilites
to remove large SMD, or source replacements.

Both Monitors- Again, don't really have the spares for these, although
most parts a generic.

Yes it is expensive, but try Atari Workshop as they'll fix it all up well.

Yes. Use Spin! or Metados (free/shareware?) for the CD ROM, see below
about HDDRiver.

>Is it possible to have a driver in english ?

HDDriver is, along with Metados and a kind soul has translated the
docs for Spin!

>Is it possible to have better disk performances with some
>other driver ?

Well, you won't see much improvement in speed as the drive your using
isn't big or fast anyway. You can only go as fast as the HD can.

>How can I listen music from the CD Rom ?

SCSI CD Rom should have audio out. You can't play through the ST's
sound, unless you want to solder to the motherboard.

>PS: It looks like a lot of people here are using "HD Driver". Is it the

If you arrange to send any of the parts to Barrie @ Keychange
then send the Falcon aswell as I will have a look at it for you
when I've got a spare 5 mins.
Probably not that difficult to get going (but you never know).

In my experiance I have seen many spooky thing's re SCSI, usually the first rule is that not all rule's apply. Depending on the device it can respond in weird ways. PC's in particular, Atari's SCSI controller's tend to be more forgiving. Usually I would try playing with termination and device ID's/order. This is not to say whatever the SCSI cdrom is was designed to specific standard's. I have seen a lot of rules bent over the years. But yes, you should be able to switch it of if the bus is terminated properly, and the drive is OK. With My falcon's, 1 has either all scsi on or off, and the other is all scsi on. Both work fine with all sort's of weird concoctions.

Hi!

David Bolt <nospam@my-ste.demon.co.uk> wrote:
>>Is gz (GZIP) the same as normal ZIP of the Atari?

> No, completely different, just as LZH and ARC are different

Nope. gzip and ZIP actually share one compression algorithm (deflate in ZIP), and it's possible to use gunzip to extract the first file of a .ZIP.

An excerpt from gunzip's manpage:

-- snip --
gunzip can currently decompress files created by gzip,
zip, compress, compress -H or pack. The detection of the
input format is automatic.
[...]
Files created by zip can be uncompressed by gzip only if
they have a single member compressed with the 'deflation'
method. This feature is only intended to help conversion
of tar.zip files to the tar.gz format. To extract zip
files with several members, use unzip instead of gunzip.
-- snap --

Ciao

Thomas

There is a program called SMS master which you compose offline, and then
rings up the respective numbers to send the text message. Again it's
pc!

ICQ also on the pc allows sending of sms messages free, yep on-line. So
maybe the atari version of icq could have it incorporated!

AGP 2.0 is AGP 4x (not the same as AGP 2x!),
the current standard, of which there is a superset,
AGP Pro, which just has additional power lines
for hungry workstation-class graphics cards. PCI is
now at 2.2.

While that can be a problem, if it gets you working with the card at
all it's a relatively small price to pay.

When I was first forced to get NVDI my system slowed down and the
graphics card slowed it way down again. This is just normal if you're
throwing around lots of graphics (comparatively speaking).

I was about to get a 56k modem this week for 39ukp (about 58usd)
because I'm starting to see that USB modems are becoming more popular
and I don't know how long serial port modems will continue to be
available. However, I'll have a look round for Zyxel and Supra now -
it'll save the aggaravation of swicthing from modem 2 to serial 2,
which I still haven't got round to as a permanent change here.

The problem to me is that suppliers rarely know (or care) what DTE
rates the modem they're selling supports. It's a job to find this
information on the box's packaging either...

> Presumably this is in addition to the boot resolution set with
> SLCT_DEV.PRG in AUTO?

That's right. SLCT_DEV choses from the selection offered in
NVDIVGA.INF.

A minor detail is that if you run Magic then you have to dump SLCT_DEV
and replace Magic's CHGRES with the one supplied by NVDI so that you
can change resolutions with the Magic desktop option. In fact, if you
do activate SLCT_DEV even once it causes NVDI's CHGRES to fail to
switch colour depths (though resolutions are still ok). The only way
around this is to run CHGRES from the desktop. Wierd but true...

I've checked this before, which helped a little, but could see nowhere
in the INF files that determined theport to be used by default. That
is, where in the INF file is SERIAL 2 port selected as default rather
then Modem 2?

> On my TT I have these settings in both NEWDESK.INF and MAGX.INF on

> don't strip bit.

Why 9600bps? I use #a0=0021, which selects the speed that HSModem
remaps to 38k4. I also don't understand why both XON/XOFF & RTS/CTS
would be selected - I only ever use RTS/CTS ...

> - for Serial 2 (in Dial.Scr called "Ser.2/LAN", exactly, without quotes):

That's little guarantee unfortunately. I had massive problems at one time with line quality causing connection failures here in Birmingham. Some telecom techies here on CiX gave me some info that showed matters to be quite bizarre, such as:

- Voice quality is so way below what's required for modems you would never hear poor line quality.
- BT sell 56k modems but don't _guarantee_ connection speeds better than 14k4, so unless you get worse than this don't bother complaining.
- BT do, however, have internal line quality standards that allow higher line quality so just pretend you do hear crackling on the line and see what they can do.
- If you use an extension from the main phone input socket, don't use those phone port doubler thingies. They are 90% of all problems. Wire directly from the port. I got this done on a free offer from my cable company and I've been at top whack ever since.

> The TT does not appear to get peek at much more than 4.3K but still

That's very likely it.

> Harry Sideras did a message which looks really helpful but he did
> not mention the max Speed of the serial ports, anyone know?
> And if they used a more 'normal' set of baud rates?

Load up SERIAL.CPX and you'll see that Modem 1 and Serial 1 max out at 19k2. Modem 2 hits 153k6 while Serial 2 gets to 230k4.

Better information is in the HSModem docs for SCC_X.TXT for the oddball rates on Modem 2.

Yes, this is possible. For information on HDDRIVER refer to
www.atari-workshop.co.uk. I can't comment on whether HDDRIVER is the
best driver, but it is the only hard disk driver for the Atari that is
still supported.

Hi Steve,

it's frightening enough driving behind a driver when you see him pick up
his mobile, usually accompanied by a swerve of the car, and clamp it to
his/her/its ear (and why do so many have a fag in the other hand?), but
the idea of him/her/it having to look down and read any sort of message,
let alone an e-mail length one, is enough to keep me off the roads for
good. Or is there some magical gagit that prevents SMS messages from
being recieved by car drivers? Looking at the market the SMS/GSM boys
are after, I would doubt it. As long as they have sold the toys, the
fact that it has directly/undirectly been the cause of lord knows how
much carnage is something they wash their hands of.
It's a dangerous toy for poseurs.

Bob.

Greetings from Wales, where men are men, sheep are sheep and the women
are glad of it.

Software wise I use ICD Pro and Extendos 2.4, always works with my Quantum HD and Toshiba CD rom.

Can't say about the Plextor, it's much faster than mine, 'tho' Plextors are mentioned in the Extendos compatibility list, try emailing Roger Burrows, Anodyne software, he wrote it.

2317. MagiC winframes question

Newsgroup: comp.sys.atari.st
Date: 2001-02-15 16:28:26 UTC
From: Grzegorz Pawlik <noend@interia.pl>
Message-ID: <96gsk8cht1@flis.man.torun.pl>
Source record: 50148

Hi!
I have tried to install "winframes" in MagiC 6.1. I have put winframe.rsc file into c:/gemsys/magic/xtension/ folder, along with winframe.slb library. However, it didn't work, and MagiC windows are still exactly the same.

In xtenstion folder I have also ????.slb file (I don't remember the exact file name right now, but it was copied there during installation process, I didn't change anything). Both of those libraries are initialized in magx.inf
file:
#_SLB 0 WINFRAME.SLB
#_SLB 0 ????.SLB
What else should I do? I have tried various winframes from MagiC on-line website, so it cannot be the fault of the .rsc files I suppose.

I have 1040STe with 4MB RAM, MagiC 6.1 and use ST-HIGH monochrome screen resolution. Is there any chance to make the winframes work on this setup?

Thanx for any answer ;)

Nope - AFAIR, the new window frames require at least 16 colors to work,
i.e. with less colors, you will only be able to use the standard window
borders.

Ciao

Thomas

2319. Atari Falcon For Sale

Newsgroup: comp.sys.atari.st
Date: 2001-02-15 18:08:47 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <GMFHluDvsBj6EwY4@lovecraft.demon.co.uk>
Source record: 50150

No suitable MegaSTE systems were offered (late model with factory HD
floppy drive, and a decent MIDI expander) - though a TT system was
offered then unoffered *pouts*, so I'm just going to sell the Falcon and
buy whatever MegaSTE/MegaST system I can find with the right spec.

Falcon030, 14Mb, FPU, 215Mb internal - mint condition.
Storage MiniTower - 1Gb + 540Mb + CD-ROM + SyQuest.
Digital VGA monitor. (as in the company, not digital control or
anything).

MagiC 5.whatever, some other useful stuff like Papyrus, NVDI, a lot of
downloaded music programs.

ï¿½300, or close offer. I value a MegaSTE (basic) at ï¿½100, a MegaST at
ï¿½70, a TT at ï¿½200 with 4Mb + TT-RAM card without SIMMs, in all cases
with a large enough HD to boot up and an SM124. MIDI expanders depending
on sofware supplied, number of channels etc. if you want to offer a
trade.

2330. Re:Falcon Ram Board

Newsgroup: comp.sys.atari.st
Date: 2001-02-15 20:51:10 UTC
From: nephelim@zetnet.co.uk
Message-ID: <3a8c413e$0$8830@news.zetnet.co.uk>
Source record: 50165

On Tue, 13 Feb 2001 Ken Kosut wrote :-

>I recently purchased a new 14 meg RAM board for Atari Falcon 030.
>Due to a set of unfortunate circumstances, the board has been
>damaged. Either by me, or possibly in shipping. Not sure.

Oh dear ! Another upgrade horror story. I know the feeling only to
well, and it really should not be like this. You have my sympathy. I
have been down this path. To me,it seems that there are some 'Atari dealers'
who need to clean up their act .

>There are two female conncectors on the board a 50pin and a 30pin
>Inside the 30pin are "box-like" conductors
>Inside the 50pin are "prong-like" conductors ..//

The connectors on the upgrade board should be of identical box-like
type to ensure good electrical contact, with the vertical pins on the
motherboard,and to minimise stresses during fitting. If your board needs
undue force required in order to make it fit, then that board is
sub-standard and is liable to cause serious and expensive damage to your
Falcon motherboard,(if not during fitting,then later as stresses caused
by heat cycling take effect.)

On Mon, 12 Feb 2001 Lyndon Amsdon quite rightly wrote :-

>>Yes, but that still doesn't explain why it's so tight. Have you
>>checked it out with a continunity test? No board should be as tight
>>as you explained. Is it possible to return it?

With a properly designed board, the fitting should not be so tight as
to cause stress to the pcb or the pins. Fitting should be firm and
positive. As Lyndon suggests,checking out with a continunity tester is
worth while, but do not forget to remove your Simms from the board
first otherwise you can blow them.

Lyndon asks if it is possible to return the board. I think that it
does need returning as it seems that the board is clearly a bad match
as regards fitting. On the otherhand, as from my experience dealing with
Cortex over a 14Mb upgrade,they did not acknowledge my return of the Simms
that they sent me,(which would only show 4Mb on my Falcon,and 4Mb on
an engineers PC !), they have not responded to any of my communications
sent since August 2000. Returning then can be dodgy ! It all depends on how
honest a firm is, and it's attitude to it's customers.

If your 14 mb upgrade board works on 4 Mb with the link on the board
at the 4MB setting, but not on the 14 Mb link setting, then I would
suggest that you consider your Simms as being suspect. Check that you

have indeed been provided with 16 Mb Simms needed to provide the 14Mb
of extra Ram in a Falcon.

If it is any help, I have had a couple of problems on two different
Falcons regarding memory during the last year :-

Falcon (1) Blank screen on boot up. Sometimes vertical columns
and garbage.

Fault identified as being caused by bad electrical contacts between
the 14 Mb board and motherboard. A hot melt glue gun had been used
to secure a piece of card onto the upper surface of the memory
board. Some content of this glue had migrated onto the memory board
pins aided by the heat from the circuit board and the cooling fan
air currents. Once cleaned off with solvent, the computer returned to
normal.

Falcon (2) Upgraded from 4mb to 14 mb.

Ok with jumper setting on 4mb,but blank screen when
jumper set to 14mb.

Fault identified as 4mb Simms being supplied and not 16mb edo simms
as requested.

Replacement 16 Mb Simms were purchased from AUT at £5 less than Cortex
charged, but unknowingly suffered damage in the post. When fitted ,I
either got a blank screen,flickering colours,or vertical columns .

Inspection of the Simms board with a magnifying glass revealed a
hairline crack between one leg of an IC and the PCB. A blob of
solder was applied, and everything was perfect ,and been perfect
ever since !

>If you have such a part for sale,..//

Good luck in your search. I would however advise against Cortex
(previously Titan Designs) where I got my last upgrade board from. I
purchased the board from them on the understanding that it was faulty
and I had to repair it - which I did. However they supplied me with
4mb Simms and not 14mb Simms which I requested.I sent them back. Six months
on, and Cortex remains very silent ! They still owe me 25 pounds.

I would like to think that I have been of some help, but it is a
difficult situation that you are in . In the UK, for goods that are sold
which are unsuitable for the purpose for which they are intended,then
you have laws to protect you (which can be effective to a limited degree
!) It seems to me that a few businesses which supply computer parts, rely
on purchasers being technically ignorant in the field of computers, and
electronic practices in order to flout these laws .

Regards,

~ Paul ~

But... I have tried connecting my STe to color monitor, booted MagiC
in ST-LOW, which has 16 colors, and used BigScreen to make a virtual
resolution 640x400. However, I still had standard windows, although
they were drawn in 16 colors. Winframe was not used at all.

I must be doing something really wrong on a very basic level, I suppose?

> 10 minutes online.

Just a side note: although it's not perfect (what *is*?), you can use Adamas with Sting's Draconis emulator. This gets rid of the 10-minute limitation. It has it's problems, but if the emulator is worked on a bit, I'm sure that will improve. It's found at: http://sting.atari.org/

Adamas has another problem that keeps me from using it: it's dead slow! Go to a page that has tables or any other complex formatting that Cab will display in about 15-20 seconds on my Falcon, and Adamas will take well over a minute in many cases. That got way too annoying.

The really cool thing about the emulator, though: it works with the Draconis version of Teli! Finally, a real Telnet client with no VT100 display problems (that I've seen)! A great piece of work! Especially compared to the fairly incomplete Telnet versions for Sting.

By the way, does anyone know if the emulator is still actively being worked on? I haven't seen or heard of an update for a long time.

No. Only an electronics shop with a RAM tester. And I am not sure
if they can test this type of RAM.

The problem is on the RAM board. 1 conductor got crunched when I
installed it. I can see it.

thanks

ken

Has anyone tried developing an Atari client for Citrix Winframe or Microsoft Terminal Server?
I have a PC running Windows 2K and if I could run one of these clients, I could run Internet Explorer
from my Falcon030.

I know that Winframe is available for Unix could it be ported?

Mike.

Thought some here might be interested to know that I am currently
laying out a new commercially printed magazine using the same system
as I used for doing Atari Computing (Papyrus & NVDI running on a 14Mb
Falcon and outputting to a Laserjet 4), only downside is that the
magazine is not about Ataris, but about radio!

;-)

Best wishes

In your last message you said you got Ser2/LAN from listport.
Have you tried setting your port name to "Serial 2"? It's odd that
Hsmodem is combining the two into one name. yes they pretty much are one
port with 2 different physical connections, however the Serial 2 or LAN
names used to be used to force the port to switch which one it was
addressing.

: Is gz (GZIP) the same as normal ZIP of the Atari? If so, it too can
: compress several folders/files into a single archive file. So what do
: you gain from TARing it first?

gz is not the same as zip.

tar (tape archive) is a file format that can store multiple files in one file, together with directory information for each file so that the files can be restored from the archive onto the filesystem with the same data and attributes with which they were stored. No compression is performed.

gzip (GNU zip) is a program that compresses a file so as to reduce its size by reducing redundancy.

Often tar is used to archive multiple files into one file, then gzip is used to compress the file so as to reduce storage space or transmission time.

I got some info about the mystery picture from Karl who knows a lot about
Atari history (see his homepage!).

(bus with Atari name in busstation Calcutta about 1990)

Here it is, so probably it was a firm profiting locally from the well-know
Atari brand name.

The message numbers on the news-server of my ISP for this group are rapidly nearing 250,000.

At an average of say 50 messages @ day that's over 13 years of messages. Perhaps the average was higher in the 1980s and early 90s.

I'm bemused first that the server could have survived for so long without a glitch, but second by the amount of wisdom or otherwise that a quarter of a million postings represents.

Anybody read them all? ;-)

Hello, everyone. I have decided to put up my ST stuff on ebay. The auction includes-

Atari STe 1040- Very good condition, works, tested, with mouse

Notator Cartridge- a very good MIDI squencer. I don't have the software, so expect someone to come here looking for it.

Atari STm 520- also in very good condition, tested. Power supply, but no mouse or floppy drive.

STart magazine and disk collection- almost complete STart collection, most issues between 1987-1992 (STacy, Transputer, etc.). All the disks to go with it.

Software- PC Ditto, some ST Format disks, Compute! disks, some text adventures (not originals).

The auction is currently at about $30. Hope you are interested. Paypal will be allowed.

I have downloaded it from
http://www.umich.edu/~archive/atari/Utilities/bigscrn.arc
But all it makes is a virtual screen, so it has no real purposes
apart from eg. testing software or just using it for fun ;) You still
have 320x200 in ST-LOW, but it is a part of a scrollable 640x400 screen.

....but what about those MagiC winframes? Since it is not the matter of
rsc file, neither color mode or screen resolution, what could it be then?
Please - anybody uses MagiC 6.1 on ST?

> Has anyone written a TCP/IP stack for the ST systems?

There's at least 6 different stacks available, STing, STiK, Mintnet,
I-Connect, AtariNOS/KA9Q and one that's used by Draconis. This probably
isn't a complete list either.

> What about clients
>like telnet,

TelSTar, Telli and probably at least one other that uses Mintnet.

> ftp

AFTP, Newsie (a news and mail reader with FTP and text browsing
ability). No idea about others for Mintnet, although a version of AFTP
works with it as well, or for I-Connect.

>, and www?

CAB or Draconis (if you can get it to work). Probably some others as
well.

Regards,
David Bolt

2371. 14 meg RAM board (questions)

Newsgroup: comp.sys.atari.st
Date: 2001-02-17 03:51:07 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a8df52d$0$70816$272ea4a1@news.execpc.com>
Source record: 50058

Hello,

I recently had some problems installing a WB Systemtechnik
RAM board on my Falcon.

I took the board to another electronics shop for a 2nd opinion.

The electronics technician examined the board.
He said the board was extremely well made and that
The "tighter - prong like connectors" are a much better connection.
He said the problem could be remedied with a new connector.

WB Systemtechnik emailed me. They wanted pictures or schematics.
I tried to do a schematic, but I don't think that is going to
do it.
I don't have a digital camera. I'd like to try to scan
the damaged part in and use Scanedit+ to show him where the
problem is.
I think this file gets saved in .IMG format.
Can I just email WB Systemtechnik this file?
Or do I have to convert it?

thanks in advance

ken

BTW - this part cannot be found in just any electronics store.
The technician said He's never seen a connector like that.

It's normal to compress files to ZIP or LZH format before sending, but for graphics it's more usual to change the format to GIF - the result is compressed by virtue of the format, and is more readily viewable by the receiver.

Since you're trying to get a problem sorted out,that solution seems to be the best.

Hi Paul,

Thanks - I am not blaming anyone. At first I thought I needed a
different connector, but the more I learn about the board,
I simply need a replacement part.
But I am having trouble conveying this to the dealer.

> >There are two female conncectors on the board a 50pin and a 30pin
> >Inside the 30pin are "box-like" conductors
> >Inside the 50pin are "prong-like" conductors ..//

> by heat cycling take effect.)
>

Yes, I agree. But I took the board to another shop today and got a
2nd opinion.
This technichian has worked on quite a few Atari's.
He looked at the board by WB Systemtechnik and was impressed at how
well made it is.
He said the 50pin connector was made for a "tighter connection -
which yields a better connection."

> On Mon, 12 Feb 2001 Lyndon Amsdon quite rightly wrote :-

> positive. As Lyndon suggests,checking out with a continunity tester is
> first otherwise you can blow them.

Yes, but remember, a prong was being bent as I was pushing downward.
And I couldn't get it all the way down. This explains why
it was so tight.
The connector looks like this: \/
The Atari pin on motherboard like this: |
So the connection is \|/
One side of \/ got "crunched" by the male pin.
It could have been defective, I don't know, I didn't look at it that
close before I put it in.
The pin on the Atari could be irregular. I don't know.

> Lyndon asks if it is possible to return the board. I think that it

> honest a firm is, and it's attitude to it's customers.

Sorry about your misfortune with Cortex.

All I need to do is get a replacement part. Then I will have the
technician install it, as it seems to be an irregular fit.

>
> If your 14 mb upgrade board works on 4 Mb with the link on the board

> of extra Ram in a Falcon.

The Simms are correct. At first I thought I received 4x32 Simms when
I requested a 1x72 simm module. (It said 4x32 on the invoice)
But the technician pointed out that it was indeed a 1x72 simm module.
The dealer emailed me and said he checked the RAM before he shipped.
I believe him.

> If it is any help, I have had a couple of problems on two different
> Falcons regarding memory during the last year :-

So did King Louis II, some weeks later there was Louis III :-).
You can read it in several interviews on ATOS as well as in the
German Atari mag "STC". On the (German) Milan website there is
the announcement that the work on the new OS (for the Milan III)
makes progress. No more premature announcements are going to be
made before anything real has been produced.
The Milan I is still available, (limited amounts) you can choose
between a 040 and a 060 version. You can also buy motherboards now
directly from Milan.

Cheers
Dan

2383. Modem Speed/Efficiency

Source record: 50068

Hi All,
Modem connect speed and efficiency:
Although I can connect at 115,200 there are a lot of "time-outs"
as compared to 57,600 which results in more continuous downloads.
This happens with NG and Web downloads. I suspect it may be a setting
in StinG's default.cfg
Any thoughts?
Running the following:
C-LAB Falcon MKI / Seagate 1g / SupraExpress56k / CAB 2.8 /
Newsie .961/ STinG 1.26 / Dialer 1.17 / HSMODEM7 PKG. / NVDI 5.01

Hi David,
Is that 250,000 messages or bytes? At times I'll get a max of 1000
posts with Earthlink's NG (about 850 posts and 265,000 bytes today).
Maybe I'm missing a lot!!! There is a difference between NG servers.

Hi

I'm sure there is an easy answer to this problem, so it won't take long.

I'm just trying to use Mouse boot with Magic, but not too sure where to put it in the order of auto prgs. Magic totally starts the system again and so it loads mouse boot back up which is annoying, but I don't want to load mouse boot after magic has intialised as I could see Mint having problems with this :)

So what's the best way guys?

Thanks if anyone can help me.

Both Ken and Paul have given the name of the supplier involved in their
respective problems.

>> " To me, it seems that there are some 'Atari dealers' who need to clean
up their act."

I am in full agreement with this statement, but until customers start to
give full details of their problems in open posts, instead of wittering like
old women in closed groups, nothing will be done.

As I said, off at a tangent but aimed directly at Steve Sweet, occasional
Lord High Purveyor of Inuendo.

See his posting under ' Atari Repairs ' 2/14/2001.

I think you are confusing the speed of the computer -> modem link and the speed of the modem -> phone line.

With your Supra 56K modem you are never going to connect to the phone line at better than 56K. In fact, if your phones are anything like those in the UK, you will probably get a DCE connection (modem -> phone) of around 44K.

As a rule of thumb data should be fed to the modem from the computer (DTE) at 2-3 times the DCE speed to allow for possible hardware compression by the modem. So a DTE of 56K is a bit low, 115K would be fine. I'm sure the Falc. is supposed to support this speed so I'm surprised you get transmission failures in the computer -> modem link.

You could take a hard look at the serial cable you are using. Is it falling to bits? Got loose connectors? Any chance the earth shielding is damaged? Perhaps you should invest in a new one, as short as you can tolerate.

> This happens with NG and Web downloads. I suspect it may be a setting

I doubt it has anything to do with STing.

>to have it a s the fist physically connected anyway, otherwise you will just
>have to turn both devices on.

No the CD-ROM is physically the second device on the bus. I haven't
tried it the other way round yet, but I may. But surely the computer
should not hang if the bus is unterminated? Specially as it all works as
soon as I switch off the EZ-135 as well... (I mean 'as soon as'
literally - can do it with the dialog open, and the computer then
'unhangs' at once.)

What I perhaps didn't make clear in my original posting is that this
problem only seems to arise with the bus-scanning feature of HDDRIVER.
The EZ-135 works fine even when the CD-ROM is off!

Ah - one up for Atari, then! But in that case why is the MiNT
distribution tarred and zipped? And can Atari ZIP unpack a gz file?

1.15.5 is indeed the last public release. I'm using since quite some
time 1.15.10b without any problem. So far it's the most stable kernel
I've used.

Hello Markus!

MA> ...does someone of you know if it is possible to
> connect the SM124 monitor to a VGA port of a PC?

That's tantamount to sacrilege! <grin>

I have found VGA monochrome monitors cosmetically identical
to the SM125. I'm sure there are electrical differences
though. Is the mono output from an ST at TTL or 'analog
line' level? I think I read somewhere that the TTM195 used
an ECL input, can anyone here confirm this? Also, does
anyone know who produced the SM125 and TTM195 for Atari?

It sounds as though you're confusing the physical form
factor of these SIMMs with their electrical arrangement.
It's probable that your SIMM is *both* in that it has 1 row
of 72 pins (physically) and 4 megawords x 32 bits
(electrically) yielding 16 Megabytes.

Hope this helps.

Under TOS you'll often get timeouts at 115k2 when using the mouse. You'll
either need an accelerator (Nemesis and similar won't do) or MagiC.
Perhaps MiNT with one of the new scc.xdd's will work too (never tried this
on a stock Falcon).

Not something to do with STinG, afaik. It's most probably that the Modem
2 port is not reliable enough on your Falcon tu run at 115 kbps. Same
problem here. TT ports are more reliables :-)

Bye,

The serial port itself is reliable, but TOS is too slow to keep up on a
stock Falcon. With MagiC it works, but just barely.

Who said it was only the Duron?

> don't think so ;-)

You missed the 2 K6-2 boxes and the A3010, all running the RC5 client
24/7. The K6-2s crack at a combined rate of 1.65Mkeys/sec. The A3010
manages about 9.2kkeys/sec and, finally, the Duron cracks at a nice
2.25Mkeys/sec when doing nothing else. It can drop quite considerably
when using apps under Win98, often to less than 1.0Mkeys/sec. Under
Linux, it doesn't seem drop anywhere near as much, even with quite a
high system load.

Adding up, you'll probably notice that the key rate is a bit less than
the 4.8Mkeys in the sig. That's because the machines in my .SIG are my
personal machines and I have permission to use the client on one other
celeron based machine. That's the one that makes the difference. :)

I've had some breakthrus with my TOS emulator (due to TOSBox's
author Mark Slagell, and STonX's open source and good overall
emulation). I've gotten my 1987 era dual-single-sided floppy BBS! Express
ST BBS running, right now, under Unix.

Its not quite perfect yet.. some weird hangs, and the telnet
support is mostly broken .. but the telnet support is easy. I've got to
add support for big floppies, or hard disk support, so I can copy BBS
files to it. But shes basicly ready. I can play space empires via telnet
right now :)

One user at a time, but hey, its all good :) And due to emulation
and running on my slow firewall, it runs at about 1200bps. Perfect!

I've been working on this for about 2 or 3 years at random
intervals (it just didn't work for most of it :P). Damn. I'm so excited :)

Hello NG.

Some hardware guru's please explain to me what is wrong with my
Falcon.
I can't boot from the hardrive anymore. It doesn't matter if I use the
new 4 Gig HD with MagiC, or if I put in the old original 130 Mb,
without Magic, just the TOS system.

It does not boot from the HD.
I can still boot it with a floppy and the system sees the HD, but will
not start from it.
It is like the system does not see the HD??? Strange or what??

Help.

You should check whether your hard disk driver is installed properly and
whether all the connected hard disks are actually found by the driver.
Usually such a check is provided with the tools included in your hard
disk driver software package.

Yes Uwe,

I did try all that. All the HD Tools see the HD, but it will not boot
from it.
It is rather funny, because when I install the old HD, the original
130 Mb with the original AHDI prg., there is no luck either. It simply
will not boot from any HD.

FamilyNet Newsgate

Hello Peter!

P> But surely the computer should not hang if the bus is
> unterminated?

A SCSI bus should always be terminated at both ends, and
only at both ends. Whether or not your machine should hang
with an un-terminated bus should be a moot question.

On an ST I imagine the host adaptor that plugs into the ACSI
port should provide termination at the computer end of the
bus. The same is probably true of a Falcon that uses an ATA
('IDE') internal hard disk.

A Falcon with an internal SCSI drive may have the host
adaptor unterminated, with the drive providing termination
(assuming it's physically at the end of the bus). The same
may be true of TT and MegaSTE machines with internal SCSI
drives, I don't know enough about them to say.

The device physically at the other end of the SCSI chain
from the computer should be terminated. All your other
devices should be unterminated.

Hope this helps.

Regards,
- Andy Ball.

I don't know if this helps but try changing the SCC driver for the SCC
driver for the AMD chip (instead of the Zilog one). I looked in my
Falcon and found the AMD type, apparantly all Falcons were supplied
with the Zilog so I'm not sure what's going on over here then.

This sounds as if your NVRAM is misconfigured with regard to the boot
preference settings.

Witch driver do you use? AHDI?

Install driver to harddrive. Bootpart. should contain a file named
xxx.sys. Thatï¿½s the driver. If the driver is installed, mound all part.
icons on desktop and save newdesk.inf on root on drive C.

Anyway, use hddriver. Best way and the program had support.

Hello.

Occasionally, posts appear here asking for advice regarding which Atari dealer to use. Not a big choice, I know of only three in the UK. I generally post offering the services of Keychange Music, others advise.....others. No problems with that, free country.
What I do have a serious problem with is the continuous posting of drivel by Steve Sweet, seeming to follow my posts, warning of catastrophy if anyone uses other than Atari Workshop

He seems to know loads of people who have complaints about various Atari dealers except A.W. and whilst spreading the alleged problems far and wide, refuses to name the dealer (s) involved.

In doing this he is defeating the object of the group, which I believe is to help and assist Atari users in their enjoyment of the machine. If there are rogue dealers he has definite info. about, surely he should gather the information and post verifiable facts in an open group instead of keeping it to his ' elite ' band, whispering in their closed group.

I therefore ask this question of the group.

Are you happy with ' spreadshot ' allegations or do you want proper details of rogues?

I have no problems at all if any of my customers wish to air a grievance about Keychange Music as long as your real name is included, you actually were one of my customers, (of more anon) and it's not about my prices.

Maybe other dealers' customers would like to recount their experiences? There are new Atari users everywhere, most without a user manual and in need of constructive advice.

The ' floor ' is yours.

Barrie at Keychange Music.

Source record: 50129

I've been fumbling around with the demo version of CAB 2.7 for a while now (BTW, does anybody know where I can get the full English version of 2.7 or 2.8 in the US?), and I just don't have a clue as to how I should set my cookie options. I've heard a lot of things about cookies, some good and some bad, and it's hard to know what to do, or why I should do it.

To review, the CAB options about accepting cookies are:
Always
Never
Always ask
Store but don't use

I've been using the last one, for lack of a good reason to use either of the first two absolutes. The third option isn't very attractive, because I've heard that some sites are very persistant in offering cookies until they're accepted. I just didn't want to be bothered. Now I'm beginning to wonder if that's really the way to go.

Can anybody explain the advantages and disadvantages of each option?

Message-ID: <3a902a3e.0@energise.enta.net>
Source record: 50120

Hi,

I am looking for a utility that can provide statistics on hard disk
speeds and access times. I tried the HDRATE program that came
with my old ICD driver but it uses an illegal instruction.

I found HOWFAST but it only draws a graph of read and write throughput
which is difficult to compare with HD data provided by manufacturers.

Any suggestions ?

Also, on the Milan what is the maximum HD speed that can be achieved
with either IDE or SCSI ?

The machine is a basic 68040 @ 25MHz. I have asked Milan about the
33MHz upgrade but they didn't respond !

Peter.

This happens because the SCC chip only has a 1 byte input buffer (sic!).
If the CPU stays too long in supervisor mode with too high priority it
will not pick up this single byte in time and it will get lost.

The ESCC chip has a 3(?) byte buffer and can handle a speed three times
higher. The same happens to me when running Geneva on a TT at 115200bps.
At 76800bps it works fine. Om a MSTe it is almost OK at 57600.

The standard chip on an Atari is SCC but it can be exchanged with a ESCC
together with the proper HSMODEM module off course.

The simple solution is to use a faster OS like Magic.

When bytes are lost STinG will discard the packet (and even crash
sometimes) with drastic speed penalty.

: Regards, /Peter/

One of the problems involved is that at least some Atari programs are cross compiled on a Linux box, which can run gcc compiler on source code in about 20 minutes, and it takes 3 hours on a TT, on one specific program.

Linux, or Unix, has gzip, tar, and compress, and those also run under MiNT on an Atari. Gzip and tar and compress also run under TOS on an Atari.

This is a very old topic. The term of art for grouped files on Unix boxen is a "Tarball".

The short answer, I guess, is that .tar.gz or .tgz files can be handled on many different platforms running many different specific operating systems.

Jim

Actually, my first guess would be Sting. I used to be able to connect with Sting with very few problems, but as I added extra things that took up memory and CPU time, I've found that I've gotten more and more timeouts creeping into the system. A little optimizing helps, but even at the best I could get it, it's still timing out from time to time. The only way I found that would fix it, is either getting rid of most of my AUTO folder and ACC extras (which I wouldn't do if I could help it) or by using STiK 2. With a good STiK 2 setup, I can go for a long time without seeing a single timeout. It does, however, limit the extra networking capabilities of STing, and I've had a few other problems with it from time to time. For example, I just tried STiK 2 again, and when I run it with Geneva and Mint, I can't get it to recognize its own RSC file. I have no idea how to fix this. I'm sure it's something simple that I'm overlooking. But as far as the original post, I would first optimize STing as much as possible. If that didn't fix it, I'd try limiting the number of programs/accesories taking up CPU attention or just try STiK 2. Then, if all else fails, look into possible hardware malfunctions.

How long for? Indecently I type at a million miles an hour and quite often only have a few minutes to check the groups during the week. I don't spell check, at all for that reason. Also I think people get the general idea. This is an Atari news group not an English grammar news group. Considering some of the posts by non-English (of which Australia is rapidly becoming, and US seems already), I think the point is taken. I have spell checked this in case it offended someone.

: Hello Markus!

: MA> ...does someone of you know if it is possible to
: > connect the SM124 monitor to a VGA port of a PC?

: That's tantamount to sacrilege! <grin>

: I have found VGA monochrome monitors cosmetically identical
: to the SM125. I'm sure there are electrical differences
: though. Is the mono output from an ST at TTL or 'analog
: line' level? I think I read somewhere that the TTM195 used
: an ECL input, can anyone here confirm this? Also, does
: anyone know who produced the SM125 and TTM195 for Atari?

The SM125 was built by several companies, but the circuits and earliest
case was of an NCR business machine monitor, and it is a good guess that
whoever made them for NCR also made the first ones Atari bought.

The TTM195 uses an ECL luminance channel. It was made by Philips Canada.

I know for certain that VGA monochrome monitors that will fit on a TT use
"composite over green", which means the green of a screen becomes the
black part.

The answer to your first question is that someone makes an integrated
circuit that takes an RGB signal and turns it into a VGA signal. Have not
seen a chip that goes the other way, but it can be done with discrete
components. VGA uses chromanance and luminance signals, and the Atari ST
monitor uses Red, Green and Blue signals. You need to extract red, green
and blue signals out of chrominance and luminance signals. Good luck!

It seems that Iconnect does connect OK - BUT when trying to click on any links in my home page displayed in CAB the system crashes - with the report that Program destroyed address xFFFF (or something like that!). It gives you the option of repairing (which doesn't work!). Then dumping the system (or something) to disk - I just hit RESET at this point!!

Thanks to Steve and Derryck I changed the Iconnect configuration for Iconnect but no joy (see above) - I am right in thinking this is a Magic system report cutting in? Or is it the CT2B? Either way I don't get it under STiNG + CAB (with a Freeserve connection that is!).

It is really annoying being so near and yet so far from using FreeOla. I am using Cab 2.7, Cab.ovl (Olivier Booklages 5.68B), Sockets (PPP_Connect 1.8) - HSMODEM 7 + SCC (modified for CT2B).

I know Lyndon was going to try to connect with FreeOla and report back I would certainly be interested in what he has to report!

Thanks again!

Neil :-(

You know, I've personally always been frustrated by the whole TAR/GZIP
thing. But as some people, especially in the Mint world think it's necessary
to use, could someone PLEASE make a unified program, with a graphical shell
(similar to ST Zip, or LZH Shell) so that those of us who aren't that well
versed in programming lingo or ideology can simply drag and drop a *.tgz,
*.tar.gz, *.tar, or *.gz program onto the icon, select the folder location
for the files to be written, and off it goes? I know it's supposed to be
"easy" to do, just by having the two archiver programs in the same folder
and knowing just what to put into the command line, but I've yet to figure
it out, and reading the "manual" that comes with it leaves me more confused
than knowledgable. Just give us something that makes sense and works,
without having to do hours of research to figure out. Isn't that supposed to
be the whole idea of a graphical GUI like GEM? Things should be made as
obvious and straight-forward as possible, and usage should be visual without
too much technical reading to do. So shouldn't the software be made the same
way? And don't get me started on the need for a good install program for
Mintnet and others...

Is there anything different I'm supposed to do with it than with 1.15.5? I
tried installing it yesterday. I renamed the 1.15.5 version from MINTNP.PRG
to MINTNP.PRX, dropped in version 1.15.10b of MINT030.PRG, renamed it to
MINTNP.PRG, made sure the position in the AUTO folder was the same by using
Autosort, and rebooted. I got bombs. I put back 1.15.5, and it worked fine.
I downloaded it twice, thinking maybe there was something wrong during d/l,
but both times were the same. Any ideas?

Sorry I can't check but the driver for the AMD version is supllied
with HSModem V7 for sure. If you read the documents it says about it
near the section about the ESSC for ST's.

I'm in the middle of changing from one HD to another so files are
flying everywhere and I can't get to one HD when this one is plugged in.

So everyone will have to know if I don't answer an email for a couple of
days or don't respond to posts etc this is why.

>
>Can anybody explain the advantages and disadvantages of each option?

In general, cookies are benign and harmless. They simply store information about yourself that the site may want to refer to later when you revisit or go to another page. "Information about yourself" might sound sinister, but all this amounts to is personalised information, such as your name, your preference settings for a particular site etc. Nothing that the site couldn't obtain normally anyway, but just wants to 'remember you' for your next visit.

Also, some dynamic web pages use cookies to store session variables between pages, like global variables within a program. Web connections are 'stateless', i.e. when you go to the next page in a web site, that page invokes a new connection and has no idea that you've gone to it from a previous page. Sessions variables allow information to be passed from page to page, e.g. you may have 'logged on' to a web site - a session variable stores this fact so that you don't have to log on to each individual page.

In other words, I would go for the Always option. It allows web sites to work properly and saves you the hassle of confirming it each time.

Thanks, I'll check that out.

JD> The TTM195 uses an ECL luminance channel. It was made
> by Philips Canada.

Thanks for that too. I guess it's just a fancy way of
saying 'ECL video signal' since there would have been no
chrominance on a mono monitor. I'm guessing the sync
signals were separate TTL lines?

JD> I know for certain that VGA monochrome monitors that
> will fit on a TT use "composite over green", which
> means the green of a screen becomes the black part.

Sort of. It's normal for a monochrome VGA monitor to send
its video on the same pin that colour VGA uses for green,
but so far as I'm aware mono VGA used separate sync lines,
where 'composite over green' implies that sync is on the
same line as video. Is this a requirement of the TT?

JD> The answer to your first question is that someone
> makes an integrated circuit that takes an RGB signal
> and turns it into a VGA signal.

Colour VGA already uses RGB video, so the IC in question
probably does something else with scan rates or sync
signals... perhaps you're referring to some sort of scan
doubler that will display 15KHz style RGB on a 31KHz VGA
monitor?

JD> VGA uses chromanance and luminance signals...

Not normally, it uses separate pins for RGB analog video
and sync. I don't have the pinouts in front of me, but
can supply them if this will help. Are you confusing VGA
and S-Video?

Regards,
- Andy Ball.

> >Inside the 30pin are "box-like" conductors
> >Inside the 50pin are "prong-like" conductors ..//

It does not really matter whether they are prongs or box-like
connectors. In my experience, I have had more trouble with 'prong-like'
connectors than with box.

>All I need to do is get a replacement part. Then I will have the
>technician install it, as it seems to be an irregular fit.

I think that these connectors are standard 0.1" (2.54mm) pin
connectors, and should be availiable from good electronic suppliers.They
are availiable in single,or double rows.They are not expensive at all,and
may be cut to provide the length required.The pins stick up out of the
motherboard , so you need to order the pin sockets.

Worth checking out with such places as RS,Maplin,Tandy etc. I really do
not think that this should be a problem, but come back to me if you
find it so.

Cheers !

~ Paul ~

This is not quite right. The SCC has a 4 byte receive buffer, but it
generates interrupts as long as there are bytes not read in this buffer. A
interrupt service routine should read all bytes before exiting, otherwise
interrupts are generated for each incoming char, creating lots of
overhead. However, it has only a one-byte transmit buffer.

>
> The ESCC chip has a 3(?) byte buffer and can handle a speed three times
> higher. The same happens to me when running Geneva on a TT at 115200bps.
> At 76800bps it works fine. Om a MSTe it is almost OK at 57600.

The ESCC has an 8-byte receive buffer and a 4-byte transmit buffer. Also,
the ESCC has a mode in which receive interrupts are generated when the
buffer is half-full, effectively reducing interrupt overhead on faster
systems.

>
> The standard chip on an Atari is SCC but it can be exchanged with a ESCC
> together with the proper HSMODEM module off course.

Yes.

>
> The simple solution is to use a faster OS like Magic.

Or MiNT with either Frank Naumann's or my scc.xdd or my escc.xdd :)

Uhm.. does not sound fun.

Source record: 50002

In article <96p76ggre1@plutonium.compulink.co.uk>,
xlator@cix.compulink.co.uk writes:

Okay, this is going to be a long post. PS, don't ask me for a better
explanation than I'm adding. It's just a case of me 'cutting & pasting'
from a post that asked a similar question in another group.

>Can anyone tell me the meaning of the non-obvious figures that my modem
>outputs when I press at&v1 please? The first 7 are obvious and I take it
>the Rtrn Counts refers to any resends that may be necessary from either
>end, but what are the others, and are there 'normal' or average values
>for them?

>LAST TX rate..... 31200 BPS

}This is the transmit rate just before the call terminated, in bits per
}second. Transmit rates are the rates at which data is sent upstream
}from your modem (the client) to your ISP (the server). For K56Flex
}and v.90 data is sent upstream using much the same old analogue methods
}used for v.34. For v.90 transmit rates are in steps of 2400bps (
}possibly up to 33600bps?).

>HIGHEST TX rate..... 31200 BPS

}This is the highest transmit rate during the call (I assume), in bits
}per second. The transmit and receive rates may vary during the call as
}a result of renegotiation. In particular modems may negotiate a high
}rate initially (it looks good to the customer on the initial connect
}response), but have to drop the rate later to get the data through
}reliably.

>LAST RX rate..... 52000 BPS

}This is the receive rate just before the call terminated, in bits per
}second. Receive rates are the rates at which data is sent downstream
}from your server to your modem. For K56Flex and v.90 data is sent
}downstream using the new digital PCM methods. For v.90 transmit rates
}are in steps of 1333bps (up to 56000bps).

>HIGHEST RX rate..... 52000 BPS

}This is the highest transmit rate during the call (I assume), in bits
}per second. It is possible that K56Flex implementations never
}renegotiate to above their initial rate, in which case the highest rate
}will always be the same as the initial rate, however V.90
}implementations certainly will renegotiate higher.

>PROTOCOL..... LAPM

}This is the error correction protocol, LAP-M is part of v.42 .

>COMPRESSION..... V42Bis

}This is the data compression protocol, v.42bis BTLZ

>Line QUALITY..... 042

}This is some measure of line quality, the lower the better. This
}parameter is calculated by the modem and used to assess when may be
}necessary to renegotiate to a higher or lower rate. The value for a
}particular line varies according to the rate, so it is not a good
}straightforward parameter for comparing lines. Neither is the range of
}acceptable line quality values the same for all rates.

}The line quality measure is also different from protocol to protocol
}and may also vary between versions of firmware.

>Rx LEVEL..... 015

}This is the received signal level, in -dBm. I have seen it said that
}figures below 10 indicate extra amplification (and therefor trouble),
}that figures lower that 25 are normal and that figures higher that 25
}may be poor.

}Some modems allow you to vary the transmit signal level, using S91 (
}others ignore the setting in order to comply with telecoms regulations
}). It may be possible to affect the received signal level by juggling
}with the transmit level and so alter the exchange's treatment of the
}line. Most S91 users though us it to tweak the TX rate. Beware of
}upsetting your telephone company with the S91 setting.

>Highest Rx State..... 67

}This is the last hexadecimal state number of the finite state machine
}used for receive protocol negotiation. It may just be useful when
}examining the reason for a line drop. Broadly states less than 20 are
}used during V.8, states from 20 but less that 30 are used during INFO0,
}states from 30 but less that 60 are used during line probing, states
}from 60 but less than 80 are used during INFO1 and states from 80 are
}used during rate renegotiation.

>Highest TX State..... 67

}This is the last hexadecimal state number of the finite state machine
}used for transmit protocol negotiation. The particular numbers vary
}from the receive state numbers above, but the ranges given above are
}valid.

>EQM Sum..... 008A

}This is the Eye Quality Measure, a measure of signal quality for
}analogue protocols. It appears to be reported in hexadecimal. For
}v.34 and the transmit side of v.90, EQM is the filtered minimum trellis
}length, an error vector. The EQM is inversely proportional to the
}signal quality, so lower EQM values are likely to indicate better

}quality lines.

}It is EQM which is used by the modem in order to determine the initial
}connect rate. Here is one suggested table for a K56Flex modem receive
}rate:

}EQM <= 0050 : 56000bps
}EQM <= 0090 : 54000bps
}EQM <= 0095 : 52000bps
}EQM <= 00A6 : 50000bps
}EQM <= 00B0 : 48000bps
}EQM <= 00C0 : 46000bps
}EQM <= 00D0 : 44000bps
}EQM <= 00E0 : 42000bps
}EQM <= 00E5 : 40000bps
}EQM <= 00F0 : 38000bps
}EQM <= 0100 : 36000bps
}EQM <= 0130 : 34000bps
}EQM > 0130 : 32000bps

}and for a K56Flex modem transmit:

}EQM <= 002E : 31200bps
}EQM <= 0040 : 28800bps
}EQM <= 0092 : 26400bps
}EQM <= 0109 : 24000bps
}EQM <= 01C2 : 21600bps
}EQM <= 02EE : 19200bps
}EQM <= 04B0 : 16800bps
}EQM <= 073A : 14400bps
}EQM > 073a : 12000bps

>RBS Pattern..... 00

}RBS stands for Robbed Bit Signalling.

}All PCM modem protocols (X2, K56Flex, v.90) rely on the digital
}transfer of data to you until it gets to your exchange. The digital
}transfer is of 8000 code bytes per second, each code byte representing
}256 possible signal levels. Present PCM protocols try to use up to 128
}of those level, giving a maximum rate of 8000 * 7 = 56000bps. But
}within the telephone network your 8000 * 8 = 64000bps line (a DS0 ?)
}is bundled with others into a four wire digital trunk.

}In Europe this trunk is an E1 at 2048000bps, it has 30 channels for our
}calls, one for synchronisation and one for signalling. In the USA up
}to 24 channels are bundled into a T1 at 1544000bps, where all 24
}channels are used for our lines then call-control signalling may have
}to be taken out of the 64000bps. This is Robbed Bit Signalling. RBS
}takes one bit out of one or more of six consecutive samples. These
}bits make the work of PCM modems more difficult than it would otherwise
}be.

}The RBS pattern shows which of the six bytes have had robbed bits
}detected by the modems. A pattern of 00 is best, that indicates no
}robbed bit signalling is used on your line.

}Robbed Bit Signalling is not used in Europe, so you should only ever
}see 00.

>Rate Drop..... 00

}This is a parameter used to adjust the initial connect rate to allow
}for Robbed Bit Signalling and possibly other factors.

}It is a number subtracted from the rate index calculated from the EQM
}in order to decide the initial connect rate. In K56Flex a value of 02
}reduces the connect rate by 2000bps, a value of 04 by 4000bps and so
}on.

>Digital Loss..... 2000

}This has taken the place of "Digital pad" reported in earlier
}implementations. Most implementations I have seen report this in dB, I
}do not know just what this 2000 from my Pace modem might mean.

}A low dB figure is better.

}Apparently digital pads in telephone networks operate on the PCM codes
}in order to introduce loss into to local calls. This is done in order
}to reduce echo and singing. Trunk calls though shouldn't need pads,
}because echo cancelling is used instead. Common values for pads are
}3dB and 6dB. It is best for modems if there is no pad, a value of 0dB
}will indicate this.

>Local Rtrn Count..... 00

}This is a count of the number of retrains initiated by your modem, the
}client modem. Retrains are initiated when either contact is lost or
}line quality is felt to be too low. A low number must be best, though
}obviously short calls may result in few and long calls in more.

>Remote Rtrn Count..... 00

}This is a count of the number of retrains initiated by server modem.
}Apparently if you force a retrain, say by picking up an extension phone
}on the same line, then this can be counted as both a local retrain and
}a remote. This may or may not be a reasonable action, because while
}only one retrain is heard to occur, the modems at both ends will have
}felt that there was cause for a retrain.

> A Falcon with an internal SCSI drive may have the host
> adaptor unterminated, with the drive providing termination

There's no internal SCSI drive in a Falcon. The SCSI connector is left
unterminated unless there's an external device connected which provides it.

Connecting unterminated devices is a Bad Idea because you'll likely get
reflections of data coming back down the bus, crash!

I know that Auto folder programs run in the order in which they were placed in the folder, but if I you were to have more than 6 accessories on your root drive which 6 would be loaded?, the first six by filename or by order as in the Auto folder.
This has never been a problem for me but I was just curious to know if anyone has tried it and what happend.

I was tempted to say that it was nothing to do with your CT2, but it might
be worth a try using the Falcon's TOS instead of the modified one. No need
to save that setting from the Help screen, just change it and hit [Esc] for
a quick test.

Just in case anybody is interested, I managed to contact the
manufacturer and he said the devices rely on an Amiga specific
signal and would definitely not work on an Atari.

Any other idea how to connect an ST to a modern multisync ?

Most modern TVs should cope with a multitude of formats and sync rates no?
I am sure my TV supports PAL, Never The Same Colour, 50 - 100Hz, etc.

What format does Germany use?

In fact what formats do countries use? (terrestrial, not cable or digital)

UK is PAL
US is NTSC (I think)

Mark.

Hi Neil

>I know Lyndon was going to try to connect with FreeOla and report back I
>would certainly be interested in what he has to report!

Yes, sorry about that length of time. I actually signed up that
night, but I tried for about an hour of solid fiddling with Stings
configuration but it refuses to intialise an IP. The script from
Freeola looks fine with what it needs but it doesn't seem to work.

I may have another go sometime, it helps to come back to things with a
fresh head.

So I'm on the search for a new ISP in the UK. If I find one I'll let
all know.

2478. Organising my HD

Newsgroup: comp.sys.atari.st
Date: 2001-02-19 10:55:06 UTC
From: bindon@madasafish.com
Message-ID: <t91usab4lqoe94@corp.supernews.com>
Source record: 50012

Hi

I'd like some advice on what I should split my HD up into. I have a 3.5" 1.7Gb IDE, ZIP 250 (SCSI) and a MiniS 100Mb (SCSI). I may be buying a fast SCSI (6Gb).

What is the best drive to read off for burning an image to a CD writer? SCSI or IDE?

How does a Minix partition help for Mint? I can't see the point at all.

LFNs don't worry me anymore, and I won't bother with FAT32 as the support isn't there.

How does everyone organise your HDs? Do you have a common folder for data so all programs access it from there?

Does this sound OK to you for the IDE?

100mb - boot partition
400Mb - Audio Visual programs/data
750Mb - CD image space
400Mb - power apps/data
100Mb - misc/utilites

But then I don't know what to use for the ZIP and MiniS?

Please help, as oce I've partitioned it and put the data on I don't want to have to BURP again.

Thankyou

Lyndon Amsdon

Once upon a time <982579140.21696.0.nnrp-12.9e98a620@news.demon.co.uk>,
Mark <mark@recycledsteel.co.uk> grabbed chalk and scrawled:
>
>Most modern TVs should cope with a multitude of formats and sync rates no?
>I am sure my TV supports PAL, Never The Same Colour, 50 - 100Hz, etc.

Not via RF, it won't.... And American TVs can't, IIRC, do PAL. Otherwise
the Laserdisc folks would be getting all happy.

(Well, I do know /some/ specialist TVs can handle it, but generally they
can't).

>What format does Germany use?

PAL, perhaps with a different audio frequency (hence the little switches
on the back of some old computers like the C64 - not the same as the
blanked off panel for different VHF channels on the 800XL).

>UK is PAL
>US is NTSC (I think)

Australia is PAL with audio on a different subfrequency (this may also
be the case with a lot of Europe), France is SECAM (a PAL derivative
with different colour encoding).

I'm thinking some islands and such may use NTSC, perhaps South America,
but most of the world is PAL.

>
>It almost certainly use blits.

The fVDI 16 bit example driver that Mario is basing the Galaxy one on has
'accelerated' mono-expand blits, but no actual text output support.

This means that the fVDI engine will render the text in a monochrome
buffer (at speeds similar to NVDI) and then ask the driver to put this
on the screen. The driver then loops around and sets pixels to the fore-
or background colour as indicated by the monochrome bitmap.

The example driver is 100% C (except for some 'glue' code), so this loop
is only as good as Lattice C can make it. For an '040 or fast '030 that
shouldn't really matter much, since the bus is likely to be the limiting
factor, anyway. On a MegaSTE, however, any kind of such loop, especially
one not written in optimized assembly can cause significant slowdown.

Anyway, when the Galaxy gets hardware support for mono-expand blits (it
might already have that), the device driver can be rewritten so that only
the monochrome bitmap itself needs to be sent to the card. When it is
done that way (the Eclipse/RageII driver can do this, of course),
displaying text in 16 bit colour should be about as fast as displaying it
in monochrome (subject to the speed of the VME bus).

Further, the fVDI device drivers are allowed to accelerate the actual
text output, without the engine rendering it in monochrome first.
In the current Eclipse/RageII driver that only works for six or eight
pixel wide fonts in normal mode, but such characters are then drawn by:
- set up fore- and background colours

- tell the card how large the characters are going to be
- for each character
- tell the card where to put it
- send the character data (16 bytes for the normal 8x16 font)
This doesn't make all that much difference with a fast processor, but a
on a MegaSTE it could be twice as fast or better.

Finally, with fonts cached on the card and with the proper hardware
support (this is not done by the Eclipse/RageII driver, but I will probably
add it in a cut-down (due to the mach64) form sooner or later), text could
be drawn by:
- set up fore- and background colours
- tell the card how large the characters are going to be
- tell the card the spacing between characters
- tell the card where the font data is (in card memory)
- for each character
- tell the card the number of the character to draw
This is as fast as it gets, obviously. The only limitation here is the
actual drawing speed of the hardware. Even a MegaSTE would be able to
draw more than a million characters per second (if the display hardware
was quick enough), which is much more than anyone would ever need.

>> it is fast enough to use applications like texts editor with a decent speed.
>> (screen redraw time is scary in 640x200 on a standard ST without blitter).

fVDI is similar to NVDI speedwise even without hardware support.
Unfortunately, there is currently no 4 colour driver, but you can check
out the monochrome or 16 colour ones if you like (the latter is a bit
limited in some ways).
If you disable the text acceleration for the monochrome driver (see
FVDI.SYS for information about 'accelerate'), the text output speed should
be similar to what you'd get with the simple mono-expand hardware features
mentioned above.

By the way, scrolling and area filling speeds are also quite relevant to
many programs and a graphics card will be _very_ fast at that.
I don't know what kind of memory bandwidth Mario is getting on the
Galaxy, but it would surprise me if it wasn't more than a hundred (might
be several hundred) Megabytes per second.

>Again, I have never seen this card but I would be very surprised if it's
>not significantly faster than any native Atari graphics chip.

It would be pretty difficult for it not to be. ;-)

Regarding another artice in this thread, the fVDI Eclipse/RageII driver
can indeed cache the AES background buffer (among other things), and
there's no reason why the Galaxy driver shouldn't do that too later on
(it's not much fun having to copy hundreds of kbytes from the card just
because a large menu drops down).
This does not change the fact that the AES (or an application in the
case of other background saves) will still allocate such a buffer, which

can indeed take up a lot of memory.

In the case of the AES background buffer, it might be possible to fool the AES into not allocating one as large as it would normally want, but that isn't possible for a normal application.

To be honest: Yes. There is no market. And remember, the hardware is not the only problem. There is hardly any new software. You cannot used DVDs, cannot browse more and more websites, etc. So even with new hardware there are more and more things you cannot do with the Atari.

Message-ID: <t92r6t4iilln66@corp.supernews.com>
Source record: 50020

Hi

I really need some help, please.

I'm trying to get my Falcon to be able to ping my STe. All the jargon confuses me, but I thought I got it all done but it didn't work.

I'm using Sting 1.26 on both and using Modem 1 on the ST and the 8pin LAN port on the Falcon. Simple Null cable with TX and RX switched.

I set ST up as 192.0.1.2 and Falcon up as 192.0.1.1 and I put subnet mask in as 255.255.255.255

If I sit at the ST and ping 192.0.1.2 (it's own IP) it's fine and the same if I go on the Falcon and ping 192.0.1.1 (the falcons IP).

The problem is if I trace route to the other computer it timeouts out, and pinging doesn't get any returned packets. Any ideas?

Next thing to do is check the connection with a game or something that doesn't require confusing IP numbers.

Thanks to anyone who has any suggestions,

Lyndon Amsdon

Sure, but the bus is accessed each time I use the EZ-135, isn't it? And
that works fine. As I said (later), it's only when using the bus
scanning functions of HDDRIVER that it hangs (and unhangs as soon as I
switch off the EZ-135 power). In any case, the CD-ROM is terminated
with an external plug-in terminator.

Thanks Andy!

My SCSI bus *is* correctly terminated AFAIK. And all other programs work
OK on the EZ-135 with the CD-ROM switched off. Furthermore, as I said
elsewhere, the computer only hangs during a bus scan in HDDRIVER, and if
I switch off the EZ-135 even while it's hanging and the dialog is open,
it comes back to life. I think it *must* be something interacting with
HDDRUIVER, but I (or Uwe) have no idea what!

> The device physically at the other end of the SCSI chain

In fact you can get HOWFAST to save data, but it's difficult to make sense of them other than in graphical form. But I think *anything* will be difficult to compare with the manufacturer's data unless they specify exactly what conditions were used with the test. One of the nice things of HOWFAST is that it runs through an increasing series of filelengths and gives you the graphs of speed v quantity of data written/read. But it would be nice if you could average several runs, perhaps with different partitions.

Sorry can't help with the Milan queries.

With a standard Atari you are not able to make any comparison with the
vendor's data. This is because SCSI and IDE are so slow with an Atari
compared with the actual speed of today's drives, that you will never
get a result near the maximum speed.

I think this may be the problem. You have created a Class C network,
all but the last octet are the same. Your subnet mask is demanding
that every octet is the same. Try using 255.255.255.0 as your
subnet mask.

I could, of course, be talking complete rubbish.

Rich.

: Thanks Mario. But in that case, why not just use ZIP on the Atari or
: WinZIP on a PC? These do both tasks at once! Or isn't there an
: equivalent on whatever gnu runs on?

The equivalent is tar and gzip. On UNIX, running both programs on a file is just as easy as running one program, so there has been no need for a single program integrating both tasks. Such a program could be made, but there would be no benefit in it (in fact it would be less flexible in how it could be used) and tar and gzip (or compress) are already available on every UNIX system.

I am not very familiar with ZIP, but I don't think it can store all of the directory information used under UNIX, which would be another reason not to use it.

MANF>and off it goes?
I could provide a TAR.TTP that is able to handle (compress and
decompress) TAR and TGZ files. It runs under TOS, but needs a command
line.

2500. SLM605... always on?

Newsgroup: comp.sys.atari.st
Date: 2001-02-19 21:34:10 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <00038bf9@fmlynet.org>
Source record: 50038

FamilyNet Newsgate

Alright, the new question for us SLM 605 owners. I have the SLM 605 set up as the first device out of the ASCI port. Then we have the hard drive and other SCSI devices connected to the bus interface box for the laser printer. So in other words, currently the SLM 605 has to be on in able for all other devices to work.

Is thre any way around this?

Thanks,

Doctor Clu

I am becoming a big fan of Lucas Film games, especially since they are not only fun but well written and seem to work beyond the ST unlike other games.

I have the game Loom, and this one is only suffering due to age. I was wondering if anyone has a few key files that seem to be corrupt on my copy. They were subfiles of Loom...

You can't have that as a subnet mask
because that essentially means the
entire IP is the network address, with
no hosts. Use 255.255.255.0 (192
being a Class C address so the first
three octects are the network number),
which makes the last octect of the IP
address the host range. Also avoid giving
any hosts an address of 0 or 255, these are
network and broadcast addresses
respectively.

Check the STinG routing table.
It's a simple text file.

I may sound stupid but was is "cracking keys"?. I have a A5000 with 2
floppys, 2 IDEs and a dirty old SCSI with Cumana interface crammed
into the orginal box :) And still on the original PSU.
Something started smoking on the mobo the other day but never found out.
It also had Lilt all over it a couple of weeks ago. It's pretty nice,
good screen rez, mode 39, and can /really/ multitask. Watch this
machine verify all 3 hard disks and 2 floppys at the same time :)

Could you talk English this time! I honestly can't understand all
this stuff about subnet mask and all that. How do I make a class A
network if there is such a thing.

Well, I've been doing that all day. Do I have to enable that serial
point to point link in the CPX.

What's the best way to check my null modem connection is good? I'm
thinking about a terminal but I want a simple one without all the
options like Connect has.

Sadly I never had an Atari that used SCSI, so I know nothing
about HDDRIVER. It does sound as though HDDriver's 'bus
scan' is balking at something the EZ-135 does, but you had
probably figured that much out already :-/

Sorry,
- Andy Ball.

Thousands more r sole's mate. It is no different, I am not a fool, I work in the industry. While some dealer's try to help not all are great. The PC fraternity is rife with snot nosed kid's who couldn't tell an Irq from an interupt. The problem is there are too many fly by nighter's, who will screw you for a quid and the bail before warranty time. How long have the Atari dealer's been going now? You will not find a single firm who has made everybody happy. There are a few firms who try harder. I would suggest besides having a go at them, tell us all about your good experiance's too, so we can gauge better what as going on. While I don't agree with alot of Barries comment's it is true that nobody will stickup for the good guy's. So just to put some perspective on the subject, I have had good dealing's with: System Solutions(UK) and Fujination (Austarlia). I don't deal much because I can source most of what I need myself. Alaso there are a few noisy people on this newsgroup, that are only to happy to tell their opinion, so lets hear it please. Sorry to carry on but it shits me. Remember you cannot please all the people all the time, but you can try.....

Hi..

I doubt it can be done. The PC outputs no less than 3 resolutions in standard VGA - 350, 400 and 480 line modes.. the SM124 can only handle 400 lines. The PC outputs an analogue signal (even in monochrome mode), but the SM124 only accepts a digital input.

You might get "sort of" a picture in 80x25 text mode, put it would be poor quality indeed.

I seem to remember the best you could do is open the back flap, but leave it
on. This will shut the fans up. I have heard of a device from Germany (of
course), that could allow you to switch it off, but don't know any more.

>letters and emails go unanswered and phone calls result with whoever you
>want being on several weeks holiday or similar. One very good thing about
>the PC platform is the choice of thousands of dealers to choose from

Problem is, everyone leaves a digital paper trail which, while it
doesn't point directly to you in a way that would let me know any
information on the individual that made the post, can still inform me
of where the post originated from, and allow me to sent a notice to
that person's ISP either requesting information on the individul for
pending legal action, or request that the user be removed from the
ISP. Now, in your case, either you or your provider has done a good
job of confusing the issue by falsifying one or more of the headers of
your post; your message ID is obviously falsified, even though it's
corroborated in your return path. The X headers suggest you're on
ic24.net, which is corroborated by your organisation header, but these
are the easiest to falsify. There is also a reference to
compulink.co.uk, which may or may not be falsified, too.

Most people don't know how to cover their tracks, though, short of
changing their E-Mail address, which is almost as much protection as a
wet paper bag is against a bullet.

>I may sound stupid but was is "cracking keys"?.

This is a brute-force attempt to crack the RC5-64 code. RSA Labs offered
a prize of US$10000 to the first person/group that correctly decoded a
message and distributed.net created client software to allows multiple
machines to try and crack the code. The clients connect to the
distributed.net servers and receive "work units". These are a block of
64bit keys, in multiples of 2^28, and the client checks the keynumbers
in each block to see if it decodes the message text.

At the moment there are clients available for many platforms, including
Acorn, Amiga 680x0 and PPC, x86 Windows/DOS/Linux, Macs as well as some
other systems. A port for the Falcon/ST has been requested, but it isn't
available as yet.

If your interested, have a look at <URL:http://www.distributed.net/rc5/>
for more details.

Source record: 49947

I have not been doing it long but I (we) are managing 6,145.43 KKeys/sec and
I have just received a few more PCs to put on there.

The Duron 650 I use with a Gigabyte MoBo and 64Mb RAM also achieves about
2.2 MKeys/sec. I must admit I do not understand the above overall rate that
they put down.

You can re-compile the code to run on a Atari (68030 required) but there is
no intervention with an IP stack so units will not be sent or received.

Mark.

Of course, it can be done : when I buy the CT060, I intend to put my
Falcon into a tower case, and then solder the SCSI wire intead of the
termination resistors on the board. But then, I'll have to plug a
terminator into the external connector, to avoid signal bouncing.

>Connecting unterminated devices is a Bad Idea because you'll likely get

I am trying to use That's Write 3.1i with mail merge and using "instructions" to calculate on the "merged" data. This does not seem to work.

The numerical data is put in alright in the document from the .DAT file but the instruction calculation ignores the figures.

To me it looks like the instruction is performed _before_ the actual numerical data is merged into the document. The calculation will off course fail if the !Text variable contains #2# instead of 65.27 or whatever.

Is this a bug in That's Write?

If so is there a workaround?

Hello.

In a world awash with VGA and SVGA monitors why on earth would you want to
connect an SM 124 to a PC? No hidden agenda, I'm just curious. Usually
people want to connect an (S)VGA to the Atari.

Barrie at Keychange.

> I (or Uwe) have no idea what!

Sadly I never had an Atari that used SCSI, so I know nothing
about HDDRIVER. It does sound as though HDDriver's 'bus
scan' is balking at something the EZ-135 does, but you had
probably figured that much out already :-/

Sorry,
- Andy Ball.

Hello Derryck!

AB> A Falcon with an internal SCSI drive may have the
> host adaptor unterminated, with the drive providing
> termination

DC> There's no internal SCSI drive in a Falcon. The SCSI
> connector is left unterminated unless there's an
> external device connected which provides it.

If there's no internal SCSI drive, the host adaptor is
probably at the 'inside' end of the physical chain, and
should be terminated. If there are no external devices
either, then it's not much of a SCSI chain ;-)

DC> Connecting unterminated devices is a Bad Idea because
> you'll likely get reflections of data coming back
> down the bus, crash!

See my earlier postings, I agree entirely that a SCSI bus
should be terminated at both ends, and only at both ends to
prevent cows falling from the sky.

Your last paragraph could be construed as implying that
/every/ device on the bus should be terminated. I'm
guessing you were really saying that if one were to connect
a single external device, it should be terminated, which is
of course correct because that device would be at the
'outside' end of the physical chain.

Regards,
- Andy Ball.

Uwe,

I think you're right. I switched to the "ever-cursed-on" Intel
platform in August 99. Yes, I'm using Windoze, because only that way I
can run programs like Fly!, or ATC-simulators.
Even the Linux bunch I installed was only for testing etc, since even
now you have something "exotic" which isn't supported by each and
every programmer.

One clue was (and still is) the SETI project, which started early 99.
Clients for every piece of hardware, almost every OS, except for
Atari. They even have a client for Amiga and there are lotsa Amiga
users crunching around.
The only way (perhaps) to run it on an Atari is by running FreeBSD or
perhaps Debian Linux. Also, you need an FPU, so the only machines
would be TT's and Falcons. Still, no client for Atari available...

To the original poster: nope, don't abandon hope on new hardware. It
may evolve, though in small quantities, made by fanatics and at pretty
high prices. You'll lag behind more and more but the Atari won't be
useless. I bluntly refuse to sell my old Stf, my cranked up TT. Nice
to switch them on every now and then, just for fun. But the day the
power supply blows sky-high, I won't spend one dime on repairs
(I've got one spare unit for the STf). Some oldies are fun to fool
around with, I'm not doing wordprocessing, spreadsheets on them.
Playing the original Pacman on it, or some old astronomy stuff which
can do things the modern Win versions can not. Or the occasional game
of Airline (german stuff) where you manage an airline company for a
year.
But otherwise, they're gathering dust.

> still supported.

Well, I will try to summarise all these things.

I have a MegaSTE (4 megs), some SCSI drives (from 50megs to 1gigabyte),
a Syquest 44megs, and a CD-Rom drive (Plextor 32x). I have the Ethernet
Rom Port adapter too.

After talking with a lot of people, I have finally reach the following
conclusion:

1) I need Magic 6 as a good replacement of the standard TOS, that give me
multitasking, new AES, new desktop, and long filename support
==> (&#65533;69.95)

2) I need to use STING to use the RomPort ethernet adapter to do TCP/IP
things.
==> (free)

3) HD-Driver would be a nice replacement to my actual "Hushi" driver in
german.
==> (&#65533;29.95)

4) Extendos Pro Gold is required to handle CD-Roms.
==> (&#65533;39.95)

5) I need NVDI 5 to makes all that stuff able to display things fast.
==> (&#65533;59.95)

Total for all that software is: &#65533;199.8 (almost 2000 francs)

Am I right ?
Perhaps they are some freeware/shareware/commercial alternatives to some of
these
products ? Is extendos the only software that allow my Ste to read CD-Roms ?

Yes, not even Magic can do this, and never tried under Windows.

I'm just trying to think what a 3010 looks like. s it one of those
all in one types? With keyboard, floppy etc in one unit?

Source record: 49957

I finally tried out the Atari 8-bit disk drive emulator 800XLDJ. I ran the program on my Atari Hades using the ST version. I hooked up a 130XE to my Hades(through the Modem 1 port) using the SIO2ST(PC) cable. I loaded in a virtual DI disk and then booted up the 130XE. I was greatly amazed when the 130XE booted up the program that was on the virtual disk. The other Atari people from my club were also amazed. I then used an old program that was included with the Xformer package called FXP. It allows one to see what files are in a SD or XLD disk and then export them out to the ST computer. You can also import or delete files from the virtual disk also. I had to turn off the caches on my Hades in order to get the FXP program to run. I exported them out to the Hades and then imported them onto the DI disk and booted up the XE computer. It booted up the program instantly. I was really happy. Now if I could just run some of the programs I am finding in ATR format, that would be icing on the cake.

Sounds like it could be, you've tried this modem on anothher machine
right? Booting from plain TOS aren't you? Maybe the modem needs to
be reset using the AT commands from a terminal, like connect.

I know there is a way to diagnose the serial port using a loopback
plug, as I've just been reading on this subject. I'm not too sure
what software though would work with it to tell you if all is OK.

Hello.

I had hoped this topic would be considered serious enough for some constructive comments.

Anyone with documented evidence has nothing to fear from legal action. I'll give you one example for starters.

In August 1998 I bought 10 unpop extra ram deluxe from Sys Sol. When tested by me before despatch 8 were faulty. I tested them on 2 STFMs with 3 sets of simms and 2 sets of working cables.

OK, Sys Sol replaced them. My point is they shouldn't have been dispatched in the first place, not to a dealer or the general public. If I hadn't tested them, as I test everthing despatched from Keychange, guess who would have got the stick for faulty goods.

For balance, I've also bought ICD Link IIs and software from Sys Sol, no probs.

> Yes, anonymous, which means you (R Sole) could be Barry.

Anyone could appear to be anyone, Lyndon. You could be Steve Sweet, perish the thought.

That is my point about real names and documents. Rumour and gossip are worth diddly.

More posts please.

>memory and CPU time, I've found that I've gotten more >and more timeouts
>creeping into the system.

I have also the same expieriences with Sting.
The screen saver T_Veille causes a lot of waiting.
When I black out the screen, things go all right.
But activating the screen again, results in stop of transfering data.
Using Newsie for fetching newsgroups was almost impossible. Emailer did not have so much trouble, but Cab was almost impossible to use together with Sting.
I have had the same problems when using FTP with Iconnect.
Now I am trying out how it works with no screen saver activated.

That's OK, I just get annoyed when I spend 10 minutes doing a post and the person doesn't read it! It's dead reliable though, so I've never needed to switch to Extendos but I will in the future as AFAIK SPin doesn't support CDRW drives.

>Especially RATSoft. That was a damn find BBS proggy.

Yeah, the 8 bits are cool.. but 8bits are such an easy machine to
emulate; like PC's.. making a PC BBS telnettable is no big chore. But
Atari ST's and Amiga BBS's are work.. but the Amiga communityi seems more
pulled together and is working on things. The ST community seems to be
dieing .. I think all the ST BBS's are gone now, since DarkChyld's went
away .. y2k bug killed the forems, and Express.. I dunno.

But I loved my ST BBS, and it will return :)

I just need to figure out how DCD works in the hardware and how
programs access it.. once I figure that out, my BBS will be up :)

Hello everybody

I recently bought CAB 2.8 (german version). I would be very interested
If I could get hold of an English documentation (either plain text
files, or ST guide files) for the package (CAB+Fiffi+Iconnect). Is
there anything available in the UK/US (web page, other ?)

Cheers

Thanks for the reply none the less. Always nice to know someone is
listening.

On the SLM 804 the answer is simple... just wedge a back hatch open, and
that way the machine it on but it is not kept up to ready temperature at all
times. The SLM 605 doesn't seem to have as simple a solution. At least not
that I have heard yet.

Not glazed, so can pick up moisture! I find using the glossy covers of
the numerous AOL CDs I get much more useful - wrapped my internal IDE in
this and could then wedge it between shield and case without risk of
short circuits.

My (HiSoft) label actually says 'Tempus version 2' on it and so does the
manual.

>X>But the non-standard shortcuts and desktop are a real PITA!
>Of course, but keep in mind that TEMPUS is (almost) as old as the ST itself!

Yes I realise that. It was an excellent piece of programming from the
speed and flexibility point of view - it's hard to find anything
scrolling faster even today. Also, I liked the possibility of storing
several strings in the 'Search and Replace' dialog so you could go back
to a previous pair when required during the session.

>In fact what formats do countries use? (terrestrial, not cable or digital)
>
>UK is PAL
>US is NTSC (I think)

NTSC is used in USA, Canada, parts of S. America and Japan. Most other countries use one or another variety of PAL. The UK one has the sound carrier offset an extra 0.5MHz from the vision carrier compared to most other countries because we have traditionally used a wider video bandwidth. Oh, and the French plus their territories and formerly Russia and much of the Eastern block used SECAM but all but the French have switched to PAL. There are some oddities in the Gulf, and in S. America some transmitters in some countries use a special version of PAL with the same colour subcarrier frequency as NTSC (PAL4.33)! Then there was the ill-fated PAL-Plus, which was meant to give better definition for 16:9 pictures but needed special receivers for that, though worked normally with ordinary sets. Used mainly by the Germans though C4 in the UK tried it for a while. Died a death now.

In the old days the IBA published a booklet about world TV standards but I don't know of a more recent version. There must be one for manufacturers etc to make sure they sell the right equipment.

Of course, these days many TV receivers are nearly universal - most in Europe at least will work with PAL and NTSC, and may have plug-in boards for SECAM decoding.

>
>What is the best drive to read off for burning an image to a CD
>writer? SCSI or IDE?

Hi Lydon!

Probably SCSI, as it's on the same bus as your CDR.

>How does a Minix partition help for Mint? I can't see the point at
>all.

No idea. Don't use either. But I believe you must have it for MiNT.

>LFNs don't worry me anymore, and I won't bother with FAT32 as the
>support isn't there.

Worth while to have LFNs on the partition holding your HTML files as
many of those use LFNs. If you are running MagiC, you can always enable
them temporarily while writing with VFATCONF. Other times this can stay
off, just when you weant to refer to them (or CAB to find them) switch
them back on.

>How does everyone organise your HDs? Do you have a common folder for
>data so all programs access it from there?

That is the ideal in some ways, but I find it too clumsy. I use my
partitions for particular purposes - C: is 50 MB for booting, all others
on my 6.4GB IDE are some 840 MB and are assigned D: to utils etc, E: to
editors and DTP, F: to fonts, G to graphical programs and graphics, H:
for miscellaneous including Internet (CAB) and HTML as well as a few
games, I: for temporary files and folders that I (ought to) move once I
have sorted them etc, and J: for Cix and BBS comms and their databases.

>Does this sound OK to you for the IDE?
>
>100mb - boot partition

That seems a bit on the large side. I would think 50MB is ample. Don't
forget that with large partitions you also have large clusters, so
that even small files will take up some 32 KB in the worst case.

>400Mb - Audio Visual programs/data
>750Mb - CD image space

>400Mb - power apps/data
>100Mb - misc/utilites

These look OK.

>But then I don't know what to use for the ZIP and MiniS?

I divide my EZ-135 carts usually into 3 x ~43 MB partitions though I have a few that are a single 135 MB partition. This is mainly used for backups.

Whew! So it is, but *very* useful to know just what it all means. The digital loss of 2000 seems to be pretty constant on my line from blink to blink - as one could expect if it a property of something at the exchange or further upstream. This is a C&W/ntl line BTW.

Now if only I could get at&v1 included in my connect script before ATH0&C1Z then I would be happy. But trying it with a comma or space between the 2 commands didn't work :-(

Doc,

I had a SLM 804 that I was able to leave the SLM off and everything else would work. The shop that I bought it from had added a power supply to the SLMC this way the box always had power and everything on the ASCI port out of the SLMC would work. The bad news is I never looked inside to see what how it was done. I would think you would only need to cut the power traces and hook up a power supply with the correct voltage to the SLMC to get it to work but, like I siad I never looked inside to see how it was done. Hopefully someone else has done this or knows how to do it.

Hang on a minute. That's a bit strong. This is a public forum in which
everyone is allowed an opinion. However in no case has Steve said what you
are alleging.

>He seems to know loads of people who have complaints about various Atari
>dealers except A.W. and whilst spreading the alleged problems far and wide,
>refuses to name the dealer (s) involved.

I myself have been using Ataris for years, and although now there are only
a couple or three companies still around that do Atari repairs, there used
to be a lot more of them.

I myself have dealt with many over the years, some pretty good, others
average, and some were simply cowboys. My experience is that AW were
average, not the best, but certainly not amongst the worst. However they
are still here, and as Steve and I live in the same region as AW they are
the people we usually use.

>In doing this he is defeating the object of the group, which I believe is to
>help and assist Atari users in their enjoyment of the machine.

RUBBISH! Steve Sweet has been involved in comms for more years than I have
(even in the good old days of the NeST) and has helped MANY people before.
I'm sure that a lot who have been around in the Atari comms scene for
years, will agree with me. You have only been around in this newsgroup
(well as "Barrie from Atarispares") for a year or so?

Steve has been a stalwart of the Cheshunt Computer Club for many years,
and has repaired countless Atari monitors at Club meetings for FREE unlike
yourself who charges for the privilege.

Yes I will admit that his sense of humour takes some getting used to,
but everyone has a different personality and if you look back on all of
his messages in the past, most of them have humour in them.

>post verifiable facts in an open group instead of keeping it to his
>'elite' band, whispering in their closed group.

If you are referring to the Cheshunt Computer Club mailing list, (that I
run) then I would point out that if you wish to become a member of the
club, then you are quite welcome to join the list. However I can quite
categorically state that there have been no such "whispers" about "dodgy

dealers" so far (until you started this thread here).

>Are you happy with ' spreadshot ' allegations or do you want proper details
>of rogues?

This is a public forum, so people may be cautious of libelling someone, which is a legitimate reason for not "naming names".

However I can remember someone mentioning during an unrelated thread some months ago, that they sent their Atari off to be repaired, but never receiving it back. I think the story was that the repair went wrong, and didn't get completed properly and the repairer after some months didn't return the machine and refund the money but actually sold the machine to someone else.

The name of the dealer/repairer wasn't mentioned, nor can I remember who it was (I don't keep months of messages, but delete them every few weeks) who mentioned it. However I might be able to find it via Deja.com or similar, if I have the time.

The main point of this reply is that I think you have been very unfair in attacking Steve Sweet for pointing out AW's good record over many years. I haven't used the Keychange service so I couldn't comment on that, but surely all Steve was doing was recommending AW, as he (and I) have not had any complaints really about them.

After all, AW bought all of Atari UK's spare parts, and now is the only remaining "Atari Service Network" factory authorised service agents that Atari UK licensed before the company ceased to exist several years ago.

Cheers!

James

>cookie options. I've heard a lot of things about cookies, some good and
>some bad, and it's hard to know what to do, or why I should do it.
>
>To review, the CAB options about accepting cookies are:
>Always

Good... never have to worry about turning cookies on.

Bad. Alot of internet ad servers will compile more and more
information about you. Making it easier to target you for marketing etc.
So far courts in the US have ruled it's their data.

>Never

What I generally use unless I hit a site where I need cookies then
I enable them. In reality it's only a portion of the total number of web
sites that really need cookies. Many will request them though.

>Always ask

Very annoying as many sites like to give you cookies via the
banner ads. So you will get prompted alot. This is the setting I
generally use when I have cookies on though. As I said on the previous
one, many sites will ask to give you a cookie, so everytime a banner ad is
hit you can almost always expect to be prompted.

>Store but don't use
>

Pointless, and to be honest I've never tested to see if in reality
this is any different from Always for the next session. If it does work
seperately then it could be of use if you were curious about what cookies
you were being sent but didn't really want to work with them. However you
could see problems if you don't want to have cookies on all the time.
This comes in with CAB assuming that you will always want to use a cookie
that you have accepted in the past.

>I've been using the last one, for lack of a good reason to use either of
>the first two absolutes. The third option isn't very attractive, because
>I've heard that some sites are very persistant in offering cookies until
>they're accepted. I just didn't want to be bothered. Now I'm beginning to
>wonder if that's really the way to go.

>

If you are purcahsing something or dealing with an online group or email list then you will probably want to have cookies. Many sites that like to do things via cookies will still work without them. In my opinion being more on the side of a privacy nut, I use the absolute never 90% of the time.

>Can anybody explain the advantages and disadvantages of each option?
>

I hope that explained them from my perspective. Many will disagree though.

Well it's STiNG, but in reality the Falcon. At least from my
experiences of the past. There is just something about the whole timing
that with alot of data coming in on the serial line and a bunch of other
activity going on at the same time that lowers the stability of the
connection. I haven't ran STiNG. But when I was on my Falcon with
StiK1.x in the way back machine, the DTE rate marjorly affected the number
of dropped packets. It was also dependent upon what else I was running.
If I was running Blowup with the hardware and a large resolution aDTE of
57600 was pushing the limit, but if I were to step down the resolution I
could go up to the level between 57 and 115 with only a slight increase in
dropped packets.

>that would fix it, is either getting rid of most of my AUTO folder and ACC
>extras (which I wouldn't do if I could help it) or by using STiK 2. With a

It's Qdialer and Geneva. It's in the docs somewhere, for some
reason the directories get confused uner Geneva and it looks for it's RSC
file not in it's local directory but in the STIK_CFG directory.

>they put down.

The overall rate is the calculated from the total time you've been
submitting blocks, and the number of blocks submitted. In my case it's a
lot lower than my real rate since I started with a single Cyrix 233
based system and have gradually upgraded.

>You can re-compile the code to run on a Atari (68030 required)

Is an 030 really the minimum required? Maybe it is for a usable rate but
a 68000/16MHz is included in a list, on their website, of expected rates
for several different processors.

> but there is
>no intervention with an IP stack so units will not be sent or received.

If the code is finally ported, the problem would come when adding TCP/IP
support as there would need to be support for at least 2 stacks,
STiK/STing and Mintnet, and probably I-Connect as well.

That's the one. Mine's also one of the earlier models with the ARM 2 on
a daughter board, rather than the ARM 250 on the m/b. It was a bit of a
nuisance when I put the IDE interface in it as there is very little
room.

The thing that's strange is that the bus scan uses exactly the same code
that's used elsewhere within HDDRIVER.

I imagine an ordinary terminal emulator would suffice, at least it would prove that your line drivers and UART were okay. Whatever you type (with local echo turned off) should appear on screen. If I remember correctly there was a basic VT52 emulator accessory on the 'language disk' supplied with at least some STs.

>in other words, currently the SLM 605 has to be on in able for all other
>devices to work.
>
> Is thre any way around this?

Inside the SLMC804 laser interface, cut the pins from the larger connector (connected to the printer) which carries the 5V supply from the printer to the controller.

Now connect a regulated 5V supply across the electrolytic capacitor that's adjacent to that connector on the controller's PCB. Now you can power the controller without the printer being on.

An alternative method which avoids the need to cut any connections is to use an external adaptor made from a D-way socket and plug, wired back-to-back but leaving the 5 volt connection unwired - you then wire the 5 volt supply from your regulated supply into the connector on the controller side.

You'll have to check in the manual or do some prodding with a meter to find the right connections for the 5volts, I no longer have the details.

Observe the correct polarity when you connect the supply, and of course this is at your own risk.

>If I could get hold of an English documentation (either plain text

No docs, but I do have all the English MDL and resource files for CAB2.8 and
IConnect 1.7 and 1.8 on my web site, DDP section, address in sig.

The CAB archive includes bubblegem help.

It's all quite easy to set up?

>between the 2 commands didn't work :-(

If you regulary use that ATH command string then you could save it into NVRAM.
Then you can reload it with ATZ. If you have another string for another comms
requirement then (assuming that you've got two "user memories") you could
stash that into the second, called up with ATZ1.

That's spot-on. The host should be terminated, that's taken care of by
resistors on the motherboard.

> either, then it's not much of a SCSI chain ;-)

Indeed not! :-)

>DC> Connecting unterminated devices is a Bad Idea because

>See my earlier postings, I agree entirely that a SCSI bus
> should be terminated at both ends, and only at both ends to
> prevent cows falling from the sky.

There are one or two cases about where following this rule doesn't work, with
all kinds of kludges needed to get it to work. The TT seems to be one of them,
mostly, AFAIK, because the host adaptor is in the leg of a "T", with one arm
going to the internal drive and the other to the external chain.

>Your last paragraph could be construed as implying that
> /every/ device on the bus should be terminated. I'm

Sloppy phrasing on my part. Only the last device on the chain should be
terminated.

I am not picking any sides with anyone (just thought I would make that clear).

Seeing as the Atari community is small already I do not think that the resent threads with 'pointing' and 'name calling' have been that productive.

Any problems or issues that people have with dealers should be resolved by them and not to see who can get the most backing from news group members and consequently divide the community.

I agree that people should post warnings about 'cowboys' and 'fly by night' outfits that are simply there to take our money (these exist in just about every line of business), but this has not been the case.

If an Atari dealer messes with me I will not simply post a few nasty mail messages but pay them a visit and resolve whatever issues there are.

Mark.

I don't think you understood me fully. If you got a load of GIFs
where would you put them? In the same directory as say Imagecopy? or
Smurf, or Positive Image or do you store them in a folder labelled
GIFs? Before on mu old HD I used to have a folder on the root of
every partition called DATA and in there, there would be folders for
file formats, so there would be GIF, JPG etc and AVR, WAV, SND.

I just trying to think of a convienient way of accessing all my files
from one point.

>I divide my EZ-135 carts usually into 3 x ~43 MB partitions though I
>have a few that are a single 135 MB partition. This is mainly used for

Yes, the ones with the butt ugly red keys on them. Just chucked a few
of those in the bin. I tried to put a IDE interface board into a
A4000 but we blew the m/b. I'm servicing a load of them. I was
going to get an Econet running but yet to find the chips/boards.

Yes I have done this many times. A small plug-in supply gives something between 8 en 12 V DC.
Inside the LSM C box you can see very easily see what is + and - (an elco is there). Find the lead that feeds the 5V throught the thick cable. Disconnect this feed.
Find a Voltage regulator for 5 V. Those have 3 pins: one ground, one voltage in and one voltage out. Solder the good two onto the print. There are really big surfaces with ground and +5V around.

That'll be cool. I miss the BBS days. I miss the sense of community,
the database sections, etc. The last BBS I called was Red Hot here in
Toronto, which, at least up 'til I left around '96/97, was still quite
popular. Unfortunately the Internet has taken over whole hog and the
once-ubiquitous BBS has gone the way of the Dodo. *sigh* The good
ol' days...

Anyway, maybe this can help revive the scene a little bit. I think
it'd be rather cool to see some form of re-incarnation of ST BBSs.

The last time I went to France (some time ago) the picture quality was really bad but that may be for other reasons.

> Of course, these days many TV receivers are nearly universal - most in
> Europe at least will work with PAL and NTSC, and may have plug-in boards
> for SECAM decoding.

I can't think that they would make a different TV for every country, but as you say they may have small plug in boards or simply have a set of DIP switches inside or something.

I am sure I have had my TV hooked up to a US video recorder of which the output is Never The Same Colour, I now have a video that can decode NTSC recorded videos so that has solved that problem. Actually I do not even have an aerial since Sky Digital launched, amassing quality (SCART every). It really annoys me when people (including my parents) pay for a high quality digital video to be transmitted for thousands of miles only to screw it up and destroy all that work with 1 meter of coax.

Mark.

Once upon a time <982769753.9468.0.nnrp-07.9e98a620@news.demon.co.uk>,
Mark <mark@recycledsteel.co.uk> grabbed chalk and scrawled:

>I can't think that they would make a different TV for every country, but as
>you say they may have small plug in boards or simply have a set of DIP
>switches inside or something.

In the US, the situation is completely different. Most US market TV sets
are totally unrelated to their European counterparts, the software is
different.

Around Europe, different regions are usually handled by different plug
in receiver boards, as are different specifications of TV.

>I am sure I have had my TV hooked up to a US video recorder of which the
>output is Never The Same Colour, I now have a video that can decode NTSC
>recorded videos so that has solved that problem. Actually I do not even have
>an aerial since Sky Digital launched, amassing quality (SCART every). It
>really annoys me when people (including my parents) pay for a high quality
>digital video to be transmitted for thousands of miles only to screw it up
>and destroy all that work with 1 meter of coax.

However, what I'd said was that the RF output would be useless. Most
European TVs can accept a composite signal at 60 instead of 50Hz, this
/isn't/ the same as NTSC. They call it NTSC only because it has a
reduction in physical lines, but when you're talking about component
video (either as S-video, or RGB) or composite, the NTSC encoding really
means very little.

The problem with sending stuff to the US is that whilst changing from 50
to 60Hz usually ends up with a smaller display for us, for them changing
the other way will change the sync of older monitors and will be outside
the range of adjustment.

>I downloaded it twice, thinking maybe there was something wrong during d/l,
>but both times were the same. Any ideas?
>

AFAIK since 1.15.10b renaming the prg name to enable/disable Memory
Protection does not work. There is a special bootmenu, provoked by
holding down the shift key during the boot proccess in which one can
switch off/on memory protection. Maybe that's your problem.
Furthermore 1.15.10b has an build in RAM-disk. Are you using a RAM-disk
like for instance fnramfs.xfs? If so delete it. It clashes with the
build in RAM disk.

I think that is the error I got when I had a cable problem on my SCSI chain (TT, Magic 6 and HD Driver 7), files came out corrupt and would normally say that when ran.

Have you tried re-installing.

Mark.

Ok, I downloaded the Mint 1.15.10b kernel from www.freemint.de. I am running the 030 kernel on my TT. Now I'm attempting to use Geneva on top of it (which doesn;t even seem that stable on top of 1.15.5, BTW). I renamed Mint030.prg Mintnp.prg to disable memory protection, but apparently that doesn';t do squat. At bootup, Mint said memory protection was enabled. Then later on, well into the driver loading procedures, I get memory violations that halt the system.

Now I'm sure Geneva (and MultiTOS, which is what I may switch back to) both need memory protection disabled. How do I go about doing this with the new 030 kernel? Thanks in advance!

Its almost ready; I had about 10 people log into it today.. it
runs slow (it emulates 1200bps until I figure out how baud works in the
hardware) and works great. I just need to reinstall all the bbs software
and games and get her going..

I've got my TOS emulator able to work 90% -- my BBS will be online inside of a few days I think, for everyone to telnet to (one at a time.. it *is* single user don't cha know ;)

I'm using a very old version of the software.. all my disks have gone bad (sigh).. I've got most of a version 1.7.0 (BBS_170.lzh). I really need the rest of it, or any other versions for that matter..

So if anyone has any of these guys, or knows where I can get them.. I'll be up faster and better! Please help!

jeff

Mint with Geneva can be quite tempermental, especially when it comes to AUTO folder order, what programs are running, etc. It took a bit of trial and error to figure out exactly what to do to get a stable system. It does run usably stable, though, if you have it set right. Try disabling all AUTO and ACC programs and Mint extensions except the bare essentials needed to run Geneva and Mint (i.e. only Mint in the AUTO folder, and only the MINT.CNF file in the MINT or MULTITOS folder, and only use the MINT.CNF file that came with Geneva - save your old one under a different name). This *should* be pretty stable. From there, begin adding AUTO programs one at a time. If anything becomes unstable, then adjust the running order, testing it before Mint, after Mint, and before/after other programs that might interfere. If it still doesn't work, the program's not usable with this setup. Once you've got a good basic AUTO setup, add ACC programs one at a time, then Mint extensions one at a time, then editing the MINT.CNF file with your personal preferences/file paths, etc. It worked on my system. I hope it works for you! It's not a fun process, but it's sometimes the only way.

I couldn't get version 1.15.10b to even make it through the boot process without bombs. I'm sticking with 1.15.5 for now.

An excellent reply to all the nonsense that has been floating
around recently. We need all the possible help we can get with our
platform. Some of it will be good some of it bad,but thats life and
we have to learn to live with it.

I have been very lucky with my 2 STE`s and 2 STFM`s over the last
few years being able to get continuos service\ repairs etc from
virtually the same source. My original repairer (TUS) passed\passes
his knowledge and help to the next in line (abra) who does the same
for the next in line (as we said in the forces,no names no pack
drill). I`m very satisfied with my service and would have no
hesitation in repeating my use of them.

Incidently receipt of non working equipment may not of course be
the fault of the despatcher,take a look sometime how packages are
handled by the carriers.As Max Boyce would say "I KNOW I was THERE"

very large snip..

That's pretty strange. I wonder whether something useful
might be determined from a diagnostic bus scan that detailed
on screen the entire dialogue. Perhaps it might indicate at
what point the EZ-135 was clamming up. Just a suggestion, I
don't know enough about the software side of SCSI to know
how practical this might be.

At last, approval! <grin>

LA> I was browsing for half an hour on RS232 standards
> and wiring pinouts and a found a corker of a site
> here http://www.airborn.com.au/rs232.html

Thanks, I'll check that out. I saw a good one a while ago
that even had screen shots from an oscilloscope monitoring
an RS232 line. That helped confirm my dim recollections
regarding 'mark' and 'space' voltages and that data is
shifted out 'feet first' (lsb first).

I need to make myself a new null-modem cable, but I have
been surprised at the difficulty I experienced finding
appropriate cable. I guess there's not much call for them
these days.

I really don't get it why people are so struggling with tar and gzip. It's
all explained in the docs. It's just a matter of RTFM.
Are people so spoiled now with all these setup prg that do the work for
them that they can't perform a basic task anymore?

Should do, but I've yet to push my modem port up to speeds in that
region. Doesn't speed the SCC, but it will aid data to be transfered
to it, which may be the problem.

I thought PC speed only worked on a falcon. if it works on the STFM let me
know. I have SoftPC running on the Hades, but I cannot get the modem ports
to work correctly. I can dial my modem using ProComm, but I have been
unsucessful using APE and JUGS. I will keep trying though.

Yes I have used the modem with a regular ST and it is ok. It makes me mad as I have used the STe to get on the NET and cannot figure out what happened. I really do not intend to use the modem port. I just do not want any more problems to develope.

GemScript is the commercial program I believe and Simple Script (I have this) is the freeware program. With this you can create a script file which will run the programs you want and will do certains things. In order works you can have a script file that will run STiK2, dial in, then call up Cab and then goto a certain website.

FYI: on a TT, Magic6.01, NVDI 5.03, Newsie 0.961 (No, I don't use the Hades on the net).

Today my Newsie screen showed that one NG and all my Mailboxes were completely empty: nothing showing at all. Panic!

I opened via Slectric the relevant folders and discovered there was nothing in the folders. Panic squared!

Then I touched a key (don't remember which) and Newsie crashed out with an error and 2 bombs. Panic ^16!

Time for thought and earnest prayer.... Rebooted MagiC. Started Newsie again: and all is well again - everything is still there :))))))

Lesson: DON'T PANIC! Think! Reboot-- without quitting or saving (if you must, use MagiC's Alt-^-Esc to kill the app, so as not to change anything: a solution to problems I have successfully used a number of times).

Phew ')
Charles.

Hi

SUCCESS!! With Iconnect + CAB that is! I have now successfully connected to FreeOla and have used CAB to surf about for a bit.

In desperation I changed to TOS4.0 and ran Iconnect - no joy still the same "Memory Block Destroyed by User Program", "MCB address", "Data of MCB" which is then dumped to disk.

I then tried the original CAB.OVL (supplied by ASH v1.05 I think) worth a try I thought instead of Olivier's OVL. I connected OK as usual - but this time when I clicked on my link to Google.com I actually got to the site - so naturally I had to see if it worked again!! I shall try in TURBO TOS7.0 next - fingers crossed!

Pity about Olivier's not working as it also works with STiNG. Just have to find a suitable e-mail and news group program for Iconnect now. Don't know why STiNG doesn't work, I changed everything to what Peter Slegg has

listed on his website!

Onwards and Upwards

Neil :-)

Hello Barrie,

>I am replying to you direct, in the first instance.You may post it to the
>group if you wish. I am forwarding several posts from Steve Sweet which you
>may have missed. You may then wish to revise your thoughts.

Yes I've read all of those messages you've sent, both when they originally
appeared on the newsgroup and again on these copies, but I still fail to
see what you are complaining about.

One of the messages....:

--cut here---
This is the start of a long topic which descended from an enquiry about
dealers in the UK into a slanging match and drew the only worm to surface so
far, Barbie Doll, out of the wood work.
If you can't find it I'll send the threads to you.

Barrie.

----- Original Message -----
From: "David and Ben Miller" <dbmiller@sympatico.ca>
Newsgroups: comp.sys.atari.st.tech
Sent: Monday, January 08, 2001 12:48 AM
Subject: Re: Atari 1040 STE

The Notator program for Atari is still one of the best sequencing
packages, and the Mega STE is a fine machine. Trouble is finding parts
and service
--cut here---

..although mentioning trouble finding parts and service wasn't even
talking about the UK! If you see the email address <dbmiller@sympatico.ca>
the .ca part means it's come from CANADA.

Now if you could repost a paragraph from one of Steve's messages that you
are complaining about.

All I can find is a message from Steve basically recommending (from
personal experience) Atari Workshop's repair service. In none of the
messages was a slur against Keychange or Analogic, in fact I couldn't even
find the words "Keychange" or "Analogic" in any of Steve's messages.

I THINK YOU OWE STEVE A PUBLIC APOLOGY.

Cheers!

James

>Barrie.

No need Barrie, I've visited Deja.com (now owned by Google btw) and have saved the threads in question. Anyone who wants a copy can get them from me on request by email or by reading them live on Deja.

Your reference "Barbie Doll" for all those who haven't seen the thread is Sean Barbieri, who was a customer of Keychange Music. Why you have to insult Sean's family name IS TOTALLY OUT OF ORDER and was uncalled for.

From reading the threads, Sean has a justifiable cause for complaint against you, but instead of you sorting his problems out, you just complain louder and louder. Is this what you call good customer service? I think not.

From reading these messages about Sean's experiences I wouldn't use your service now, not even if you paid me.

Cheers!

James

Source record: 49941

I wouldn't mainly post anything but these messages really got me going.
I have just searched the group and found multiple postings by
"Steve Sweet". Who is "Steve Sweet", what does he do, does the net
give him the right to post in this way? In my opinion did this person
ever make it out of the school playground (primary).

BTW SYS SOL once supplied a 3.5" replacement drive to my mate,
it was a standard drive and wasn't compatible with the Atari, upon
using it he trashed 4 discs full of data before investigating. Upon
complaining to SYS SOL they refused to accept responsibility and
would not refund any money. A northern company inspected the unit
and found it didn't detect disc change and replaced it with a descent
drive that did. They are no longer dealing but at least they where
technically competent.

There were many Atari dealers years ago. Could this group handle all
the tales of woe.

Maybe Ann Robinsons replacement could investigate?

Mark Gray

>I've seen screen shots of things like Fortress. What did they give,
>apart from files. How can you "hang out" at a BBS? How do you get
>into one, a terminal, telnet?

They gave a lot of things; technically, a BBS would offer message bases, files, and online games. Message bases could be local, or shared with other bbs, or thousands of other bbses (via Fidonet; sort of like usenet). Message bases built a community, since you'd usually have the same groups of people posting in them. Same for games.. friendly competition. Often BBS's served as a launching point for face to face get togethers.

Files were always important.. with no web or ftp, you used bbses to get updates to your favourite shareware or the like.

You dialed up to a BBS with a modem and terminal software. Another thing long dead..

I don't think BBS's will ever exist as they did, but I hope to have mine as a fun big one.. it'll start small, and always be single user (one person at a time, which limits its accessibility sadly).. but ough to have a large base of friends. If I get smart, I might make the message bases shared onto the web as well as in the BBS..

>Thanks, I'm a bit of a novice it this area and I'd like it if someone
>could answer those simple questions.

When my bbs opens up in a few days, I'll post here and you'll be able to try 'er out.

PCspeed is a ST only hardware emulator, the Falcon emulator is called falcon
speed;-)
SoftPC is pretty fussy, havent tried that tho....

EMULATES 1200 baud?

That's kinda cool, actually. What if you could pick your baud rates? I'd like to call a BBS at 300 baud, just to remember what it's like.

>How can you "hang out" at a BBS?

This question is not as simple as it looks. Physically, I suppose it meant calling into the BBS, spending a half-hour or so and responding to posts in the forums.

But why the feeling of "community" is different here on the web is hard to say. Even Usenet -- which is very much like a community -- doesn't feel quite the same. :-(

I remember drooling over MiGraph OCR when I first read about it, but
some years after those articles by G�nter Minnerup he stated that
Alexander's OCR was far and away a better and more intuitive product.
I always trusted G�nter;'s judgement on these matters.

OCR v1.4f is the last verson I heard about and it's freeware.

From: "Barrie at Atarispares" <barrie@keychange.co.uk>
Date: Sun, 18 Feb 2001 19:02:06 -0000

>Occasionally, posts appear here asking for advice regarding which Atari
>dealer to use. Not a big choice, I know of only three in the UK.
Define Atari dealer please ?
Any clown can call himself an "Atari dealer" these days...

>I generally post offering the services of Keychange Music,
Ever heard of ethics? some people might call your "offerings" SPAM. Just suppose that all your collegues would offer their "services" here as well. If you really need to make publicity then you should do so in the suitable media, but certainly not in CSAST.

>What I do have a serious problem with is the continuous posting of drivel
>by Steve Sweet,
Your "serious problem" with Steve is merely the fact that he advices people to consider a well established dealer, I can't see any harm in this, what's so abnormal about a person advising/informing another person of a positive experience? You seem to overlook that this is USENET... it's here for the users not for the dealers...

>He seems to know loads of people who have complaints about various Atari
>dealers except A.W. and whilst spreading the alleged problems far and
>wide, refuses to name the dealer (s) involved.
I know lots of people also that have had serious problems at a given time with various "Atari" dealers, but it's not up to me to name these dealers. If these people choose to lick their wounds then that's entirely up to them. You know very well that Steve or for that matter no one except for the direct involved person is in a position to name the dealer(s). It's a pity IMO that these people don't want to speak out in public.....

Luckily some people do speak out: I remember a thread that was running last month in computer.sys.atari.st.tech.... topic: 1040ST
Message-ID: <3a60b9d411bafb0@ic24.net>, something to do with Keychange and Sean Barbieri IIRC :-/

>If there are rogue dealers he has definite info. about, surely he should
>gather the information and post verifiable facts in an open group instead
>of keeping it to his ' elite ' band, whispering in their closed group.
That "elite" band and the closed group you're refering to is either a mailing list or personal mail . A mailing list is not exactly "closed", private mail is strictly personal, and so is the content...

Cheers from Belgium
Dennis

>I could provide a TAR.TTP that is able to handle (compress and
>decompress) TAR and TGZ files. It runs under TOS, but needs a command
>line.
That's exactly what Michael doesn't like..
A command line is like a blast from the past, we haven't bought an Atari to use this kind of applications, on a Atari that comes standard with a very good GUI we don not really need TTP applications.

MiNT users can use the GuiTAR shell, MagiC users can pack/unpack TAR and TGZ

files with the Jinnee plugins provided ASH Scripter is installed. TOS users have to revert to that bloody command line...

Could one of the MiNT users explain me what's so special about GuiTAR that it needs MiNT? this is after all only a graphic shell... what routines are used that are not available in either TOS and/or MagiC?

Cheers from Belgium

2633. Digital SCSI HD

Newsgroup: comp.sys.atari.st
Date: 2001-02-22 09:23:49 UTC
From: Micka&#65533;l Pointier <mpointie@eden-studios.fr>
Message-ID: <972lgt$8ni$1@reader1.imaginet.fr>
Source record: 49857

I would like to know if someone manage to use
Digital Equipment disk drives of type:

- Digital RZ23L (109 megs)
- Digital RZ26L- E (1.05 giga)

I have those disk, and I'm not able to use them on
my MegaSTE. AHDI and HDDrive (demo) are able to
"detect" the RZ23L, but do not determine what drive
it is (AHDI says "Identification unavailable"). But there
is nothing about the RZ26L-E. The drive is not detected
at all.

The following URL gives some information about that drive:

http://www.alyon.org/InfosTechniques/informatique/drives/digital/all/931206002.html

Is it possible to use theses drives on my MegaSTE ?
Perhaps is it because my SCSI cards are too old ?

Any idea ?

Mickael Pointier

> >So what do you gain from TARing it first?
>
> GZIP can only compress a single file.

This is actually not true. gzip can compress multiple files
into one compressed archive. The only thing is that is does
not dig into subdirectories doing that.

The gain got from using tar/gzip tandem is that it:

1) retains all file attributes and casing (not true for STZip)
2) is faster than STZip and feels equally fast as LHarc.
3) produces shorter archives than STZip and LHarc.

When you are on a proper MiNT system, you neve feel like you
use two programs for packing or unpacking the archive, because
tar can automatically invoke gzip. So you only type:

tar cvf archve.tar.gz folder/

to create an archive or

tar xvf archive.tar.gz

to unpack it. It is very convenient in daily usage, and
not only MiNT users, but also all other Unix users all over
the world can prove it.

ST-Zip, btw., just sucks, it has more bugs than code in it.

>That's kinda cool, actually. What if you could pick your baud rates? I'd
>like to call a BBS at 300 baud, just to remember what it's like.

I'd like to have a selectable baudrate; I'm sure baud works based
on a bunch of timers I dont' fully understand; so right now, it always
runs at 1200bps (even if the program sets it higher, since I donn't
implement rsconf yet.. not sure how to do baud :/). But 1200 is cool for
now.. thoguh I'm sick of it by now and need 9600 badly :)

It'd be cool to write a terminal->telnet app that makes dialing
noises, carrier noises, busy tones, and does the goofy stuff like
enable/disable character echo, etc.

This means that something is most likely wrong with the cables (bad, too
long) or termination. This is almost always the reason for effects like
this, where things sometimes work, sometimes they don't.

The MegaSTE does not support real SCSI, only ACSI.

And, leave the port alone and just try HSMODEM, DRIVEN.PRG and MFP.PRG
in the auto folder of a floppy disk as it provides some debugging as
to why a chip won't work.

GuiTAR uses the extended pexec mode 100 to start tar and gzip as
parallel processes. This isn't supported by plain TOS. The problem
with MagiC depends on a bug in the old mint-lib 0.55. By time I will
recompile it against 0.56, that should cure this unsuitability.

Ralph

When I run HDDRIVER.PRG, it says "00.00: "
Really looks like it detects something, but is not able to find
what it is...

> > The following URL gives some information about that drive:
> >

Ok, so just go at:

http://www.alyon.org/InfosTechniques/informatique/drives

Then select "digital / ALL", and on that new page you click on
RZ26L-E (it's on the top of the page, 4th line).

> > Is it possible to use theses drives on my MegaSTE ?
> > Perhaps is it because my SCSI cards are too old ?
>
> The MegaSTE does not support real SCSI, only ACSI.

Well, it's not a SCSI card inside the MegaSTE, it's a SCSI
card that was in an external box with a 100meg Quantum
drive. Someone say it's an "Omikron" SCSI card, under the
box was written "Golden Premium 52 Hard Drive for Atari ST".
(The original drive was 52 megs, but the previous user replace
it by the 100 meg quantum one).
I have another SCSI card that was in a Pizza like box that of
```

brand "Lacom" that contais a SyQuest SQ 555 (44 meg) and a
little 40 meg HD (Seagate ST 157 N).
I'm not sure these two SCSI cards are able to handle these
digital drives, but at least they are both able to detect and
handle either with AHDI or HDDRIVER the following drives:

- Quantum 105 LS
- Seagate ST 157-N
- Plextor 32x CD Rom
- SyQuest SQ555.

If they are able to deal with this, it means it's REAL SCSI, no ???
So, if they manage to detect those drives, why are the RZ23
and RZ26 not detected ???

I really would like to be able to replace my 100meg drive by
the 1.05 giga one...
Would be cool.

Mickael Pointier

Does it? IIRC it requires atleast AES 4.1 (I believe MagiC is up to this
now), and tar.ttp and gzip.ttp. I could be wrong though, as I don't use
GuiTAR myself. It's usually a lot faster to use a shell.

Are you sure of that? To pass tar through GZIP you must IMHO use -z

-z, --gzip, --ungzip
filter the archive through gzip

To pack a file in a tar.gz (tgz) archive I use the following:
tar -zvf

>
>to create an archive or
>
>tar xvf archive.tar.gz
>
>to unpack it.

Again I think you must use the -z option

tar -xzvf

>It is very convenient in daily usage, and
>not only MiNT users, but also all other Unix users all over
>the world can prove it.

It's very convenient indeed. If one use an alias for the above commands
it can even be more easier to use.
>
>ST-Zip, btw., just sucks, it has more bugs than code in it.

I can confirm this. One day I tried to unpack a 126.000 bytes zip
archive. After two minutes ST-zip was still busy to unpack the archive.
After I'd aborted the action I found that the unpacked archive was
already 25 MB. I assume that without the premature end of the unpacking
ST-zip would have been written to disk until it was full.

Hi Peter

>Ok, this is probably a dum question, but...
>
>What is GEM Script and what does it do for me ?

Pop by the Ash website and check out the description of Jinnee and Scripter, pop by the author's sites, that'l tell you more.

Aniplayer supports GS, as does eMailer, iConnect, Fiffi, CAB to name but a few.

Basically use of a GemScript interpreter such as Scripter allows you to control your system using a script language.

E.G. You could write a script to log onto the net at a given time and download a page or a site, whilst thats occuring you could instruct your mailer to collect mail and news. You could automate a web-site by training a GS to watch your source material and update to your website automaticaly as required.

Simpler examples would be to run a system backup, copying specific files to specific locations under specific criteria.

Source record: 49829

Hi Lyndon

>I never had the chance to get in on the BBS days, but what is it. I've
>seen screen shots of things like Fortress.

Back when you were in nappies the Fortress was the place to be, run by a young fella called Kevin Osborne from his folk's house in Plumstead S.London. Kevin also run one of the first international registration schemes for shareware BBS software.

The Fortress saw many incarnations, from a mere ST to a T28 powered STE, a PAK powered Mega4ST and a few (sad :-)) months as a multi processored NT powered Doss-box emulating under MagicPC, and even running for a few hours from my PAK'd MegaSTE whilst repairs were underway.

Ive still got the FaST Hard drive case from the first incarnation, i hope to have the rest as soon as i soften Kev up. :-)

>What did they give, apart from files. How can you "hang out" at a BBS?
>How do you get into one, a terminal, telnet?

Basically, NeST or Fido BBS's were internationally networked in a manner similar to usenet, routed according to a NodeList, a text file determining hierarchy, the BBS sysops paying the cost of this routing out of their own pocket..

"Users" would access the BBS's using Mailers, Tossers and Mailreaders in a similar manner to the way you'd access UseNet but only one user at a time would be 'on-line' at anyone time..

Address looked like (some of my old one's)

Address 90:102/105@nest.ftn
Address 95:160/101@fanfiles.ftn
Address 100:101/13@turbonet.ftn
Address 2:254/105.9@fidonet.org

Some software used in that era were..

Semper: a mailer, allowed 'users' to access the system, leave mail and collect, upload and download occurring simultaneously, full duplex mailtransfer using a protocol known as Hydra. Also managed file access known as freq'in (File requesting), restrictions allowed as well as password protection.

Jetmail: tossed your mail, sorting it into specific bases, seperating private mail from public also packed outgoing mail and adressed it to the corect destination.

LED: Used to read and edit mail.

Octopus: A self contained mailer tosser freq'r, allowing multiple
users access where hardware allowed.

You missed an era...
I'm off to swap war stories with Derryck.

Hmm?

The system is telnet based and running on one of my 24-7
servers. So it'll be available all the time and you can use it as long as
you like; of course, if your net access is local dialup, then you may have
to pay for that I guess.. but thats your business :)

I have to figure baud out fast, since 1200bps is cute, but it'll
drive everyone batty in no time ;)

Hi Charles,
I have a sneaky suspicion it may be a Newsie bug or it's innability
to cope with server upgrades or conditions since similar reactions
happen across the pond here also! (stock Falcon MKI). Lately my ISP
has even been crashing my computer on connecting with Sting more than
before also.Using a different dial-in phone # to the same ISP
(different server) with a terminal program showed varying log-in prompts
(one of which givesme a long row of bombs with Sting which litterally
cuts my screen in half).

Message-ID: <MHfl6.887$oX3.40855@newsread1.prod.itd.earthlink.net>
Source record: 49881

Some improvement has been made here by changing the MSS to 1484 in
Sting's default.cfg and MTU to 1524 in the Dialer. The latter of which
I accidently found was changed by my ISP from 1500. A difference of 40
was recommended by Ronald Andersson. Still plenty of time-outs though!
I'm thinking of replacing the chips in the modem circuit some day to
see if that helps also (last resort).

I think It'll be too expensive to be honest. Even if each machine
would be £20 (very unlikely I reckon) That would total about £300 and
then you'd need to think about cabling and this and that, and the
person I'm doing it for doesn't have that kinda cash. He's just had
to pay out for new mice as the old ones were stolen.....

What's the world coming too? People nicking Archimedes mice?!

Hi,

Just to say I have found an extremly fast and reliable ISP that
supports newsgroups that works wonders using STing. I say this as I know
from personnal experience that some people are looking for a new ISP.

Well it's UK Fantastic go here: http//www.ukf.co.uk

I've just signed up and so far all is well, and a hell of a lot faster
than my current account. Support for ISDN and K5flex, V90. Seems to
give all the information out for people not using Microsoft.

And....it's website is compatible with CAB 2.7!

I actually haven't tested newsgroups yet, but they do support them so
I see no reason for them not to work.

Maybe. My Speedres-card (18/36MHz, later modified to 20/40MHz) didn't help
much though. This is a software-problem, and can only be avoided with
significantly faster hardware (unless the software (driver) is replaced).
I suggest you use 57k6 instead of 115k2, or atleast don't use the mouse
while online.

I've put loads of people on UKF: PC, Mac
and Atari. Sorry, I must have missed the
original post.

I think you'll find the home-user sign-up
page is actually on www.ukfantastic.net
as I recall there are a number of other
UKF pages that don't give anything
useful. I was looking everywhere on
one of its pages and couldn't find the
sign-up page anywhere. Turned out I
was looking at the wrong UKF site.

>that's used elsewhere within HDDRIVER.

Hey ?!?
What's the hell with HDDRIVER ? Both my 2 IBM drives aren't recognized
anymore since I've been using HDDRIVER! They seem to be ignored.
But, if I boot with a floppy with HUSHI, they're there again. And they
vanish again if I boot with HDDRIVER...
Would HDDRIVER hate IBM at the point it would refuse even to deal
with peripherals from them ? I do need those hard drives! These are
1 Gb drives that help my 2 Gb Quantum.
Any idea ? Hmm ?

Lyndon could go up from 50Mb to 64Mb without increasing the sector size further. This might be a reasonable compromise.

I use a dozen partitions on this half gig drive and use either 32 or 64Mb depending on what data I store there.

Is there a way of forcing smaller sector sizes on a large partition? I'm thinking that this would be useful to do on the drive that holds WWWCACHE due to the vast number piddly files that tend to get deposited there. I'm sure there is a way, but I haven't looked for a long time...

Hi Dan,
There's a check box beside each cookie that gets dropped in
cookies.dat. I've made the assumption that tis means you want to turn
this particular cookie on. Is that right? All the others default to an
unchecked box...

What did you format the drives with, how are they partitioned? Did you use
the autoconfigure option in the HDDRIVER menu? Formatting with ICD etc can
cause headache's.

So by this reasoning then every Atari ever fitted with a Marpet
Xram upgrade should have gone soggy, blown up and burst
into flames by now.

Better check all those ST's for signs of soggy cardboard
and impending disaster.

Is a plastic case flame retardant ?

>
>Oh, sorry. I always thought that a BBS was dialed up from a special
>number, as they used to advertise there own number. I see what you
>mean now, I can use my ISP.

yep; normally they are phone dialup based (terminal style, not
using tcp/ip or other networking protocols.. simple terminal dialup). But
there are a few telnettable bbs' online.. all PC's, since they often used
an extra library/module to talk to the serial ports.. and that module can
be replaced by one that does networking. The trick with mine is it will be
the only Atari ST bbs online, since its a huge pain in the ass to do it. I
think theres a couple online Atari 8bit BBSs, since they're easy to
emulate.

Once I get mine stabalized and useful, I'll see about making the
code more useful and releasing it, so we cna get a few more ST BBS' around
:) Show those PC guys a *real* system :) (OKay, those softwares are often
better, but thats beside the point)

I use HDDRIVER on my Falcon and it never had any problem recognising
the 4 GB IBM SCSI HD or the 20 GB IBM IDE HD. So it can't be an IBM
problem. Maybe an ICD problem ?

On the outside, the 3010 and 3020 are virtually the same except for
joystick ports on the '10 and the "F" keys. Inside, AFAICR, the '20 has
a built-in HD whereas the '10 required an interface.

On Wed, 21 Feb 2001 19:37:51 GMT, jeffm@nbc.netcom.ca (Jeff Mitchell)
drooled an embarassing wet spot in his lap as he typed:

> Its almost ready; I had about 10 people log into it today.. it
>runs slow (it emulates 1200bps until I figure out how baud works in the
>hardware) and works great. I just need to reinstall all the bbs software
>and games and get her going..

Cool stuff! I remember 1200 baud. When I upgraded to that (an
SX-212) from a 300 baud XM301 on my 8-bit Atari, I felt like I was
flying. By comparison that thing just zoomed along. Until, of
course, it died a horrible death and I had to replace it with a GVC.
Which was all good 'cos the fact that the SX212 had no hardware DTR
annoyed the hell out of me; I'd have people log off my BBS and forget
to hang up, so my line would be occupied 'til they got round to
discovering why it was they couldn't dial out to another BBS.

Ah, the glory days...

Hello Uwe!

US> The MegaSTE does not support real SCSI, only ACSI.

Out of interest, can the MegaSTE use an internal hard disk?
If so, is this via a separate, internal SCSI host adaptor
or some sort of ACSI <-> SCSI adaptor? I know very little
about ACSI.

Tschuss!
- Andy.

I'm guessing it sits in the chain, but physically 'near' one
end. If that's the case, Atari should make host adaptor
termination optional (via a jumper say). I hope they didn't
just 'jam' termination on at the host adaptor and 'hope' it
was close enough the physical end of the chain to terminate
the bus properly! :-(

FAT32 helps out here, AFAIK. I've partitioned it now so I ain't
turning back until next time I move up to a larger HD. Or when I get
a large SCSI unit alovely 16,000 rpm with 16mb of cache, very unlikely
though :)

They did need an interface, but I never seen any joystick ports. Are
they 9pin D style?

It was recommended on a persons site as the best to go for, ranked
number one out of a list of ten. I've seen few that give out the name
servers, usually this involves an age on the phone to the useless
technical support, at one quid a minute.

Whatever the drives were formatted with doesn't matter : they would
at least be seen by the check device option, wouldn't they ?
I used SCSITOOL prior to HDDRIVER.

Not used ICD software for at least 6 years. Used SCSITOOL instead,
with good results. However, as I wrote in a previous reply, no matter
the soft the drive was formatted with : the scan option should show
it. SCSITOOL does, but HDDRIVER doesn't.
I feel perplexed...

2694. FREE Atari Software with Hardware Purchase! Cheap Hard Drives!

Body handling: HTML body converted to readable text

e-mail: atari@benjamin.net

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've done some trading and buying from other Atari Dealers. I'm Adding to my stock & catalogs. Also, I have some Atari ST Hard Drives I don't wan't to bother with, like SH204, a MegaFile and I think some Supra's. So if your interested? Make me an offer. Like I mentioned earlier, I acquired from some Atari Dealers, +NEW in BOX 8 Bit Software as well as ST Software. And I'm about to add an Atari Collector's Collection to my stock, which I'm trading for one of my most prized Collectibles. All of it In very Good or Mint Condition. And thats just the Hardware! I still haven't seen the inventory of Software and Books/Reference Material!

Buy Atari Hardware and receive free Atari Software. Make me an offer on which Software you wan't. Offer is less likely with a cheaper Hardware Purchase. Please Redeem offers in E-Mail. First come, first serve.

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
atari@pacifier.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit,
ST and Jaguar Hardware/Accessories, Software/Games & References/
Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's

2695. Unrecognized drives

Newsgroup: comp.sys.atari.st
Date: 2001-02-23 15:15:22 UTC
From: Jean-Luc CECCOLI <Jean-Luc.Ceccoli@wanadoo.fr>
Message-ID: <WS3.04d9a17d.23d65e01.Jean-Luc.Ceccoli@wanadoo.fr>
Source record: 49820

Hello,

Since I've been using HDDRIVER, both my IBM 1 Gb drives aren't
recognized anymore - whatever I tried.
I used HUSHI (SCSITOOL) before, and I had no problem.
Now : my drives are resp. ID 1 and 3, 0 being my QUANTUM 2 Gb
drive.
1- I boot with HUSHI on floppy : all 3 drives are recognized ; I
can partition, format, test, aso,... all 3 ; IDCHECK sees all 3 drives.
If I then run HDDRIVER, it sees all 3 drives as well.
2- I boot with HDDRIVER on floppy : only ID 0 drive is seen ;
running whatever software doesn't change anything : both IBM
drives aren't seen anymore.
I tried setting jumpers, but no change.
So, my question : what does HUSHI (and CBHD and CECILE
as well) that SCSIDRV doesn't ?
These drives are resp. a 0662L12 and a 0662S12 SCSI.

J.-Luc

>SUCCESS!! With Iconnect + CAB that is! I have now successfully connected
>to FreeOla and have used CAB to surf about for a bit.

Excellent. You'll find that you'll be able to use the auto download and surf features with the IConnect overlay, plus if you have fiffi and Emailer then they're all usable simultaneously whilst you're surfing.

>Pity about Olivier's not working as it also works with STiNG. Just have
>to find a suitable e-mail and news group program for Iconnect now. Don't

Either ASH's Emailer or Atak's AMail prog with the IConnect overlay. I didn't get on with it when I tried it out recently though - it was extremely slow downloading email and no newsgroup articles made their way to disk despite lots of modem activity. Your mileage might be different, of course.

I have to say that the misuse of apostrophes is one of my pet annoyances -
there's absolutely no excuse for getting it wrong.

Apostrophes are rare and should be sprinkled carefully.

Is the driver installed ?
Are the id 1 and 3 active in "Divices and Partitions..." ?
What if you set up an IBM as id 0 ?

ha! I didn't even run a BBS until I had 1200bps.. though I teruly
loved the 300bps connection sound, I didn't dare run a system until I had
the blazing power of 1200. Besides, I couldnt' afford anythign back
then.. I was still a dumb kid. But by the by when HST came out (what was
it, 9600HST, 2400bps normal?) things really got fun..

BBS is all set up now.. it still can crash in a number of ways (my
emulation isn't perfect), but it seems pretty stable. Lots of games dont'
work under it, but I've got an old SEE (SEE10 and 11 dont' work yet.. SEE6
does), Galactic Empires, and DDST working so far. For DDST I'll have to
code a VT52->ANSI translator, or find a newer version that supports
ansi/vt102 for todays terminals...

So much fun :)

jeff

I think we will aution them off to getmoney for midi cards/econet stuff. They're used for Sibelius 6. We scraped int he region of 3 or 4. We have IDE interfaces taken off them well. The ones without IDE were simply useless. I'm very fond of the A5000 though. Gotta be seen to be believed, all the HD's and floppys are held in with Parcel tape. The case is only ment to support one IDE HD, and we didn't have a mounting bracket for the other floppy.

> LA> Then on one we put 240v through it.

Black and white monitors do not have any "pixels". Actually your computer
RAM is faulty!

Thanks James, but as I said in the csast-tech thread this
unfortunately this the mentality you are dealing with here - so no
real surprise. Is it any wonder why serious Atari users would want to
have any dialogue with someone who resorts to childish name calling?
Remember _theoretically_ this is supposed to be a from a
professional Atari dealer.....I'll leave other users to make up
their own minds on this....

Therefore, as a technician are you trying to tell people that every job you
have ever undertaken has worked perfectly every time and that you
have always left every customer completely happy. If you ever try to
claim this then I will call you a liar and it will just prove your bumptious
attitude.
You MUST of course be a very GOOD engineer to feel that you have the
right to criticise another engineers work.
In all the departments I've supervised over the years the engineer who
thought he was always right was generally about as welcome as a damp
fart in a space suite.

1 use Mint?

2 if you are not messing with the OS you can write an interrupt handler
which does the context switch for you and ofcourse a routine for starting
threads. Both things have to be done in assembly.

Succes

Hi Jo,
Well, 57,600 is what I normally connect at! Every once in a while I
get the urge to try improving my set-up and sometimes (accidently) I
come across a parameter that helps (like finding out my ISP changed the
MTU from 1500 to 1524 which, in turn, makes my MSS to be set at 1484
instead of 1460). There are less time-outs with the new MTU/MSS at 115k
but still not good and there are dropped packets in Dialer/Tools/Stats.

I agree BUT...the ' Barbie Doll ' tag was a reference to his ability to
follow instructions, not his name.

> Thanks James, but as I said in the csast-tech thread......

What you said in the thread was you have documented evidence of what
occured, none of which has yet appeared.

You and Sweet make a good pair.

If you can still stuff a hard drive after 2 resets you deserve anything I
want to say about your capabilities.
I include your memory here, matey. I have the relevant docs in front of me.
The drive came back TWICE, not 5 times, each time corrupted. It was
despatched back to you in full working order using ICD Pro software. The
last time it arrived here, according to my notes, the case had been opened
and the rear panel was damaged. I reformatted it, connected the I.D. switch
and returned it in full working order.

Care to comment on the fact that out of several hundred customers since 1994
you are the only person to post here whinging about your self inflicted
problems which occurred May to September in 1998.

In fact, you may be able to help others. You tried to install HDDriver 7
after I supplied the drive with ICD Pro installed. I mention it because
there are currently other topics running about problems with hard drives and
ICD has been mentioned..

For myself, I have always found ICD Pro to work every time.

Barrie at Keychange.

Now that you mention,
In Amsterdam Central Station there are 4 of those.
I also remember a article in some magazine about them.
I think at least 10 years ago.
I suppose the machines I saw are still working. Floor space is very expansive
in railway stations in these privatization times.
The machines look a little bit sad and exhausted. (just like some of the people
hanging around in railway stations. :-)

...very long-windedly and near impossible for the average
user/non-programmer to understand. I really don't get why programmers have
to make things more difficult on the user than they need to be.

> It's just a matter of RTFM.

... which confuses the crap out of those who don't understand the concepts
and lingo the FM assumes the reader must obviously have.

> Are people so spoiled now with all these setup prg that do the work for
> them that they can't perform a basic task anymore?

The problems come when the manuals are nothing but technical jargon, which
assumes that the user knows a fair amount about Mint, programming, and how
the program should work in the first place. For example, I RTFM for Tar/GZIP
and came away more confused than knowledgable. So we're not "spoiled", we're
just not big on techie jargon, especially when we have to read through 5 or
6 screens of it just to get a decompression program to work. Besides,
believe it or not, there are people using Atari's that have little or no
technical knowledge, and just use them because they're easy to do. And when
they run into a major techie haven like the Mint scene and get told that
they're "spoiled" instead of receiving help, what are they supposed to do?

As far as my own personal situation, I understand the basic concepts, but I
get lost in the language used. If someone would write the manuals in plain,
easy, step-by-step english instead of programmer-eze, then there wouldn't be
so much of a problem. For example, I'd like to see, right at the top of a
manual, an example of the most common thing for an inexperienced,
non-programmer to want to do. Like this:

For decompression of a *.TAR, *.TAR.GZ, or *.TGZ file, enter:

"GZIP -XYZ123 d:/filename.tgz" in a command line, or

"-XYZ123 d:/filename.tgz" after double-clicking on the GZIP.TTP icon.

For compression of a *.TAR, *.TAR.GZ, or *.TGZ file, enter:

"GZIP -ABC987 d:/folder-or-filename" in a command line, or

"-ABC987 d:/folder-or-filename" after double-clicking on the GZIP.TTP icon.

Or even better, use GEM for what it was invented for, and what Atari's are supposed to be known for. Make graphical shells for all these so it's more visual and obvious. That way, the techies can use their command lines to their hearts' content, and the average Joe can use the graphical interface. When we have such a great GUI, it seems backward and illogical to force people to revert to the ancient past of text-only commands with cryptic codes, where the thing won't work unless you know exactly the right coded combination of letters please the Unix god. If you're bent on how great command lines are, that's fine, use these the way they work now. But that's not for everyone, and no, we're aren't "spoiled" and we're not lazy nor illiterate. We just don't have time in our busy schedules to read through long, cryptic online manuals that give us too much technical info and not enough clarity.

> so I ask direct: is't enaugh to set A7 to different values
> for different threads ?

Nope, I am afraid you have to change the whole register set (depending on
the C-compiler).

I would do something like this:
1 find out which thread was running
2 copy d0-d7/a0-a7 to register save space of the thread
3 copy the programcounter and statusregister from superstack to save spave
for PC and SR of the thread
4 select next thread to be sceduled for execution
5 copy PC en SR from save space of the new thread to stack
6 copy registers from savespace to registers
7 execute a RTE

I would install the interrupt routine in a timer interrupt or in the VBL
que. Some extra routines to start and stop threads.

What are you going to do BTW?

I think youre trying to be amusing, should we stick to facts for the sake
of the thread and civility.

Dont forget, %100 humidity isnt rain, but merely fog. Most hi spec
equipment should be able to cope with %40 humidity otherwise nowt would
work in the tropics without being hermetically sealed.

> What are you going to do BTW?

I'm building an Atari parallel network. for my ideas I need some threads
(for low level communications, small process management and
calculations).
because there are many ataris so I have to load my applications by
remote communications (you remember, the other question ...).

but every Atari has only 1MB of RAM without harddisk. in this way there
is no MulitTOS or Mint or whatever heavywight OS possible. I think it's
the easiest way to do multithreading by an timer interruper.

BTW. I have had a look to RTOS-UH, what do you think about ?

I have a PC Ditto II board installed in my 1040STf. If you have the board, I do not see any copyright issues with sending you a copy of the software. I could also scan the manual. Do you need both the installation and operating? If you have not yet installed the board, be prepared to do some soldering. The "snap on" board does not make a reliable connection. Once soldiered into place the PC Ditto board works as it was advertised, providing a decent XT DOS computer. For years, I ran PFS First Choice for DOS, on my ST, without any problems.

>Any other idea how to connect an ST to a modern multisync ?

There are both internal and external scandoublers/flickerfixers for the Amiga.
The external one can't really rely on many specific signals, since the
particular signals of the Amiga video port are mainly clock and genlock signals.
Generating those signals, which as opposed to the multitude of display modes on
the Amiga shouldn't vary much on an ST, should be doable in just a few euros'
worth of components.
There are other external devices which convert any RGB or composite signal to
VGA frequencies, perhaps a TV->VGA converter, if one of those should have a
SCART or other RGB input.

The only thing that code might simply recompile on would be a MiNT machine.
After all, the Amiga client will want a bsdsocket.library.

Ehm... This will only work when the program runs in user mode. SO you will
have to restore the USP. And you will have to take care that the interrupt
is not during an other (lower priority) interrupt.

> > What are you going to do BTW?
>

That is quite a project! Be warned, the parallel port is unbufferd, the
soundchip is blown to peaces quite easily.

> but every Atari has only 1MB of RAM without harddisk. in this way there
> is no MulitTOS or Mint or whatever heavywight OS possible. I think it's

Is the main thing of the project building the network yourself or starts the
fun when all applications are running?
In the last case there are ready to start network solutions for the ST. Lnet
worked quite fine for me:

---------->8----------
Dies ist eine &#65533;berarbeitete Version von Dirk Woithas 'Little Net', die
insbesondere auch mit BGM-Partitions zurechtkommt; auzerdem ist durch die
Verlagerung des Treibers in den AUTO-Ordner auch ein Aufl"sungswechsel ohne
Absturz m"glich. Wer Little Net noch nicht kennt, sollte es sich zun"chst
besorgen, da diesem Paket keine Dokumentation beiliegt. Alternativ kann man

sich auch Thorsten Pohlmanns 'Medium Net', eine andere
Little-Net-sberarbeitung, besorgen (liegt als MEDNET.ZIP z. B. in der MAUS
WI2). Die dort vorhandene Dokumentation ist sinngem"z auf die vorliegende
Version zu &#65533;bertragen. NB: in Details sind diese Dokumentationen nat&#65533;rlich
f&#65533;r die vorliegende Version nicht richtig.

Hier einige Bemerkungen zu dieser Version (History):

;===
;
; DIWO's Little NET
;
; Programm zur Kopplung 2er ATARI ST &#65533;ber die MIDI-Schnittstelle.
;
; Jan 89 by Dirk Woitha
-----------------------------------8<---------------------------------

Sorry folks, the documentation for the program is in German. The program
runs a network over Midi. Remote hardddisks are accessible like local
harddisks. I even played games of it (games running from harddisk will run
from Lnet). It not as fast as a hardisk (or a well writen parallel network).

> BTW. I have had a look to RTOS-UH, what do you think about ?
Nothing, I don't know that.

Cu, Hans Wessels

>>What is GEM Script and what does it do for me ?
>>
>
>GemScript is the commercial program I believe and Simple Script (I have
>this) is the freeware program.
Not really...
GemScript is a protocol for GEM applications which is used by both Simple Script and ASH Scripter. With these applications you can execute/construct GEMScript compatible scripts...

>With this you can create a script file which will run the programs you want
>and will do certains things.
Note that the scripts from Simple Script and ASH Scripter are only "basicly" compatible meaning that they understand the basic GemScript commands. Since ASH Scripter is much more advanced, its scripts can't be executed by Simple Script, it's like comparing ST-Basic to GFA basic, both are BASIC interpreters but that's about all they've got in common...

>you can have a script file that will run STiK2, dial in, then call up Cab
>and then goto a certain website.
In order to do this, the application *must* be a GemScript client, since STIK isn't, the above can't be accomplished. CAB however like most ASH software is a GemScript client...

Cheers from Belgium
Dennis

Yes, I can see how things were very differnet. I have an extremely vague memory of seeeing a BBC micro on some sort of BBS, maybe '90 or '91. Can't remeber anything and wasn't really paying attention to what was on the screen, just looking at the chip socket on the left hand side of the computer. I can see how those days were better for everything Atari.

Yes, sorry forgot to mention that in my post. Title began with an S and probably a T as well (like all do), but not sure about the machine it needs. You're probably right about it not running on less than an RPC though. I can't see an A3000/4000/5000 running as a ST at anywhere near full speed.

Hmm, didn't spot these, they may be 3000's then. I'll check Monday or
Tuesday.

>appreciated......

Sounds as if you've got a program in the Auto folder (if you use MagiC check the C:\GEMSYS\MAGIC\START folder or maybe it's APPS folder), or possibly a Desk Accessory .ACC file installed that does passwords.

What you need to do is to bypass the boot process and then disable the offending program (by renaming it to xxx.prX instead of .prg for example).

You need to boot as normal, but as soon as the hard disk driver comes up on screen you should IMMEDIATELY hold down the ALTernate key, and keep it held down until you get to the desktop.

NB: Depending on which hard disk driver program you have, you may need to use the CTRL (control) instead of ALT or maybe both together.

If this works correctly and get to the TOS desktop (you may need to reinstall your hard drive icons) you should then go into the C: drive (assuming that's your boot partition of course - for most people it will be) and disable the program.

If you have no idea which program it is then I suggest you disable all of them and then experiment to find out which it is.

If you get stuck, feel free to email me.

Cheers!

James

Hi Mark

>Therefore, as a technician are you trying to tell people that every job
>you have ever undertaken has worked perfectly every time and that you
>have always left every customer completely happy. If you ever try to
>claim this then I will call you a liar and it will just prove your
>bumptious attitude.

No i'l not claim that, thats not possible due to the nature of the equipment i deal with, however i accept my (extremely rare) mistakes and (almost non-existant) errors personaly and certainly dont try to blame the customer for the equipments misgivings.

>You MUST of course be a very GOOD engineer to feel that you have the
>right to criticise another engineers work.

I am a very good engineer, i regularly get sent into places to repair stuff no-one else can, i get stuff shipped to me from all over the place for my personal attention..

>In all the departments I've supervised over the years

Dont people get made supervisors to keep them out of the way of the real work. In my trade you get made a supervisor when you begin to talk more shit than you can repair.

>the engineer who thought he was always right was generally about as
>welcome as a damp fart in a space suite.

That depends on wether you have a fart fetish doesnt it.

In my trade, youre respected for your competance, people respect your technical authority, this is no shit but there isnt a fellow technician in my firm that doesnt know my name, for i am god. How many multi national firms have you worked for where the directors know your first name and phone number.

People who behave the way you describe obviously arent very professional in their attitude.

Lets take note of one fact, "Engineer/Technician" is a qualification, something you study for and earn.

Take note, that just because you proclaim yourself with the title engineer, i doesnt neccesarily make you any good.

Loads of people set up fettling enterprises and just call themselves engineers when in fact they are just "Fettlers"

A fettler is just a wanker with a screwdriver and crossed fingers and
usually a poor reputation outside of their circle.

Source record: 49704

FamilyNet Newsgate

Hello Mark!

AB> ...a Marapet RAM board that I used to upgrade a
> friend's STfm. The board arrived okay, was easy to
> fit and worked fine.

MG> May I just ask the learned group what was on the
> bottom of the Marpet Ram board?

It was that long ago that I don't remember. It may have
been plastic. It might just have been card, but I didn't
notice any cockerels on it ;-)

MG> Has your machine ingested large amounts of
> precipitate, gone all soggy and burst into flames.

I hung on to it for a good while, mostly running a RAMdisk
and often running MiNT. It worked fine for me, but I don't
recall leaving it out in the rain very much! :-)

MG> Some posting are just plain old shit....

Some are, this one probably is.

...so anyway, when I went back to my own 512Kb STfm I
fealt the need for a RAM upgrade. I was fortunate in that
one of mine had a main-board that used 256K x 4 bit DIL
chips. I happened to have some laying around in a scrap box.
I soldered in four sockets, plugged in four chips and off it
went. That was my primary machine for quite a while. I had
a very crisp SM125 monitor and a 1Mb STfm. No cooling fans,
no hard disk... it was virtually silent and a joy to use. I
spend so many hours in front of computers today that I'm
tempted to get another one :-)

I seem to recall that the Marapet (Marpet?) RAM board came
with a good manual that outlined STFM mainboard and memory
controller revisions. Anyone here know how many STFM board
revisions there were?

Regards,
- Andy Ball.

Message-ID: <aseabrook-2ECCB9.14331224022001@corp.supernews.com>
Source record: 49788

The Elysium Atari and TOS Compatible web site has moved!

THE elysium.atari.org REDIRECTION NOW POINTS TO THE NEW LOCATION!!!

The 'real' address of the pages has moved FROM:
http://www.users.zetnet.co.uk/aseabrook/a_index.htm
TO:
http://members.madasafish.com/~aseabrook/atari/a_index.htm

I heartily recommend everyone uses the elysium.atari.org
redirection, not least because if I need to move the pages again,
you'll still have a way of getting to the site.

I intend keeping the Elysium Atari pages up for as long as anyone
finds them useful, although with a change of primary computer
platform, a new job and a lot of other projects on the go, I doubt
they'll get updated much further. I would like to thank everyone
who has been so supportive and complimentary about the site.

best wishes,

Ashley Seabrook

Out of necessity, and with some regret, I have now moved platforms and am now selling off nearly all my Atari kit.

I have thoroughly enjoyed my seven years with Atari computers, and I shall miss the camaraderie of the Atari online community. I am keeping an STe to remind me of the good times.

So as not to annoy people on c.s.a.st who aren't interested in buying anything, below is a very brief list of the items for sale. For full details and prices, take a look at the following web page:

http://members.madasafish.com/~aseabrook/for_sale/atari.htm

I'll keep posting this brief list to c.s.a.st (minus, of course, items that have been sold) every so often, but the most up to date list will be on the web page.

I've enjoyed using this kit, and now it is time for someone else to enjoy it, hopefully every bit as much as I have.

Offers or enquiries to aseabrook@madasafish.com

best wishes,

Ash

There was some good doc's included with Trumpet Winsock for win3.1 but
since my 386 blew I can't see them. Looking on the net may help find
the relations between them, and maybe a call to your ISP will give the
values.

There not really mine to say who can have them. Strange as they're
common as muck over here in the UK. Go to a school, look in the skip
and there you have it.

Err, I can't get on with Telstar. Say's Busy then it says BBS hangup
or something like that, oh yeah with no carrier. I'll try another
telnet prog if that helps.

Yes, indeed. This could be a termination/cable problem. It would not be the first time that such a problem causes strange effects like this one.

>
> Ok, so just go at:
>
> http://www.alyon.org/InfosTechniques/informatique/drives
>
> Then select "digital / ALL", and on that new page you click on
> RZ26L-E (it's on the top of the page, 4th line).

Doesn't look unusual. BTW, is there an auto-spin feature (jumper) and if there is, is it enabled? Even though the SCSI standard requires a drive to report a name even if it is not spinning, some drives might not fulfill this requirement.

> I'm not sure these two SCSI cards are able to handle these

Yes, probably your problems have something to do with this cards. If, for example, this driver requires initiator identification only a LINK96/97 (or Falcon/TT SCSI) would work.

> If they are able to deal with this, it means it's REAL SCSI, no ???

No, definitely not. ACSI misses several features of SCSI, e. g. initiator identification. There are several drives known to require this and these drives cannot be used with other host adapters than the LINK96 or LINK97.

> I really would like to be able to replace my 100meg drive by
> the 1.05 giga one...

Try another drive, not the one from DEC.

Sure, most of these machines were equipped with an internal drive right
from the start, often a SEAGATE 157N.

> If so, is this via a separate, internal SCSI host adaptor
> or some sort of ACSI <-> SCSI adaptor? I know very little
> about ACSI.

It's an ACSI <-> SCSI adapter manufactured by Atari. The only machines
produced by Atari with a real SCSI port were the TT and the Falcon.

He should simply configure the driver correctly, as described in the
manual. Copying the floppy version is not such a good idea because it
checks any ID, even those not used. This will substantially delay the
boot process. "Auto configuring" should take care of everything.

Hi, I have a Turbo030 accelerator, 50Mhz 030, 50Mhz 882, 4 Megs 32bit fast ram, Tos 2.06, 68000 on board for compatibility. Fits MegaST's , runs great, is superfast.

Also have 1040STE, tos 2.06, 4 Megs. A Matrix M110 monichrome video board for MegaST's, and a Supervga board for MegaSTs made by Wittich Comp.

Ill let it all go for the first $250 +shipping.

No, just by this character and as I've shown - I haven't forgiven him
at all.

There is a _big_ difference in companies who send stuff and something
goes wrong - that can happen anytime and to anyone. The crunch come
how they deal or don't deal with things properly when things do go
wrong. Sometimes however an apology is all that's required, other
times not.

2786. GEM TV by Woller

Newsgroup: comp.sys.atari.st
Date: 2001-02-24 21:57:41 UTC
From: peter.slegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3a982e55.0@energise.enta.net>
Source record: 49717

Some time ago (via e-mail) I had the opportunity to ask
Woller about their GEM TV software. Here is what I found
out:

Q. Does GEM-TV need a 33MHz Milan 040 or can it be used
on the standard 25MHz machine ?
A. 25 MHz is enough.

Q. Which TV cards are supported by the GEM-TV software ?
A. Hauppauge! Primio and Primio FM.

According to the British Hauppauge pages it looks like the
TV-Go and Primio-FM cards have composite video inputs.

The PCI-FM(Nicam radio), Camera and Theatre cards also have
s-video inputs.

Q. I would like to use one of the cards that has an S-Video input,
is that possible ?
A. These cards have standard TV-cable- and composite video inputs.

Q. Does GEM-TV work with the PCI-FM(Nicam radio), Camera and Theatre
cards or has it not been tested ?
A. At the moment, only the TV/Video-Features are supported by
Woller GEM-TV.

Q. I would like to to be able to grab video clips from my camcorder
through the s-video cable as the quality is a lot better than
composite video. I don't know if the s-video function needs extra
software support.

A. Maybe, if the card is successful, we (Woller) will add the other
features too and also will check the features of the bigger cards.

Conclusion
It looks as though only the 2 basic Hauppauge! cards have been tested
with GEM-TV and the software supports the normal tv transmission inputs
of the cards and the composite video inputs.

Maybe someone is lucky enough to have access to one of the better
Hauppauge! cards and a Milan could test it with GEM-TV ?

If the normal TV and composite video features work then maybe Woller
might consider offering those cards in the GEM-TV package. This
may enhance sales as the existing users will have an easier upgrade
path if the GEM-TV software is enhanced later.

Has anyone tried the GEM-TV package ?

Peter

Hi Andy,
I remember the Marpet Ram board having cardboard on the base
to insulate from the metal shield. As you say your machine
worked fine afterwards so do you agree that the insulator must
have worked.
I see from your cut and pasting below that you may have taken
my post out context. My posting wasn't against Marpet or yourself
but was directed at Steve Sweet who had made some
extremely stupid remarks so I was simply taking the Mickey.
Have a look at some of the other threads and you will see
what I mean.

As for
> MG> Some posting are just plain old shit....
>
> Some are, this one probably is.

was directed at Steve Sweets crap.

> the customer for the equipments misgivings.

I for one do not believe you. I have never met an engineer who hasn't made
a few big gaffs in their time. It is human nature to make a mistake no
matter
what your level of training or experience. Next you will try and tell me
that
you have never had a customer complain even though they are in the wrong.

> >You MUST of course be a very GOOD engineer to feel that you have the
> >right to criticise another engineers work.
>
> I am a very good engineer, i regularly get sent into places to repair

No. A good engineer is made a supersisor to help the not quite so gifted
ones
and to ensure that the workshop performs the best possible repairs.

> >the engineer who thought he was always right was generally about as
> >welcome as a damp fart in a space suite.
>
> That depends on wether you have a fart fetish doesnt it.

Or just expell the same smell when they talk.

> In my trade, youre respected for your competance, people respect your

> Loads of people set up fettling enterprises and just call themselves
> engineers when in fact they are just "Fettlers"
>
> A fettler is just a wanker with a screwdriver and crossed fingers and
> usually a poor reputation outside of their circle.

And aren't we the opinionated one.

I have worked for companies such as De-La-Rue and was sent
all over Europe repairing equipment and training engineers for the likes
of BP Germany, ADS Anker and Citizen. I personally have never
criticised another technician/engineer to the level that you have because
not everyone is as bumptious as yourself. You must be a very up
yourself person to even write the above and I would have hated you
to have worked in one of my departments.

I seem to remember a recent thread about redundancy.
Have you applied to the BBC for Ann Robinsons job yet?
You would probably fit right in as she only listened to
one side of a story and had a god like mentality. I also thought
she was a bit of an arse hole, not unlike someone else.

Ok then, lets keep my reply civil. In my opinion a piece of cardboard
even quite damp would not cause enough conduction at 5 volts
to cause the devastation you wrote about. I could however see the
devastation, rape and pestilence that you tried to cover your
arse with in a previous post if you did indeed chuck it in the fucking bath.
I also think that the piece of cardboard stuck on the back of a board
for insulation would be the least of your fucking worries if it was
powered up at the time and you were sat in the fucking bath.
(sorry to the group but civility flew out of the window)

Also before you respond with more shit read "CONDENSING",
it doesn't say "NON FUCKING CONDENSING", do you know
the difference.

Sorry Martin, we are not all like you.
I typed my first commandline in 1976. On a mainframe running a OS that was immensely more spophisticated than Unix. Nevertheless I was bored immediately.
Before that I punched my commands in cards.
Once punched, these cards could be used over and over again.

I left the pro scene in 1883. When I discovered ATARI ST and its GUI in 1987 I promised myself never to type a commandline ever again.
If a program isnt GEM, it is not for me.

Computers are invented to be convenient to their users, not the other way around.
The text IO approach of Unix is intented to be used by operators.
Modern home computer users are not operators. I am not a operator.

Programmers holding on to text IO, are not skilled enough, or just too lazy.

2799. ISP TROUBLE

Newsgroup: comp.sys.atari.st
Date: 2001-02-25 00:59:42 UTC
From: phantomm@eastky.net
Message-ID: <979ldumli1@nd.eastky.net>
Source record: 49732

Having a problem with my ISP, maybe someone will know how to solve.

Recently, my ISP announced that they are changing the Number the folks in my area use to access the Net.

They have gave me 2 numbers to try and use.
None of the work! The problem is that when my modem tries to connect to their modem system the carrier is dropped at the point were normally it would connect!

I'm fairly sure the problem is not on my end as all I am doing is changing the access number.

Also, I can access other ISP's in my area just fine, I'm just not registered with any of them at the present time. (That will change very soon!)

I have been speaking with the Techs on the matter and they have told me that everything is the same except that they are using some type of WinModem System. I think this is just a large Modem that handles all Users Connections.

I have also noticed some strange Tones when my modem is trying to connect to these new numbers. Some times it is a High pitched Tone, other times it is very Low. And sometimes it sounds just like any normal modem does when trying to connect but still hangs up the phone line just when it sounds like you are going to get a connection!

Now I Use Sting on a CT2B Falcon, my modem is a Hayes Accura 56K modem.
I have also been trying to connect to the new numbers using the Term program STalker. It connects fine to my old normal number, but will not connect to the new numbers. Stalker also connects to the other ISPs in my area as I have already mentioned above. I've tried just about everything I can think of.
I've been using a modem to connect to BBS for at least 10 years so I do know that the problem isn't with my Computer or modem unless there is sometype of Modem incompatibility that I'm not aware of.

Now does anyone know what the problem with the ISP is?

I did talk with a Engineer at the ISP, and he mentioned something about the way I am getting routed to the ISP and I might be getting connected to a ASCEND Terminal or something like that. I did have some problems months back similar to this. Instead of connecting to the ISP, I was getting a ASCEND Prompt instead of a LOGIN prompt. But now I can't even get connected to see if that is the case or not.

If you have any answers to this problem then E-mail your replies.

If the problem is not found in a couple of days then I will loose access to the NET with this ISP and will have to switch to another one. Which is no

major problem. But I would like to stay with this one if possible.

Now folks that exchange e-mail with me or folks that are in the middle of buying/selling/trading with me. All deals will still be on. But you might not get a e-mail from me for a few days, untill I get setup somewhere else.

If you have anything important to e-mail me, then do it now because I will loose access probably by Wednesday if the problem isn't fixed.

Thanks and I'll be BACK, Bigger and Better, Stronger and Faster!!! :)

>Ok then, lets keep my reply civil. In my opinion a piece of cardboard
>even quite damp would not cause enough conduction at 5 volts
>to cause the devastation you wrote about.

Bollocks.

I usually clean my PC keyboard by disconnecting it, washing it with water and salt-free detergent, and drying it in the airing cupboard for 48 hours. This technique works for so many different things - I've used it to save a powered mixer that had beer spilt on it at a pub (ran it under a tap in the bar for a good length of time, then dried it at home), various old keyboards.

Until I got around to cleaning my Dell keyboard. It had a cardboard liner - this, despite being apparently dry, retained enough moisture to cause the keyboard to fail even after 48 hours in the airing cupboard. Removing it entirely cured the problem.

The conductivity is caused by the 'pollutants' in tap water. Distilled water does not conduct, IIRC - I once ran a ZX81 submerged in distilled water alongside a conventional one, running the same complex math problem. The conventional one got /very/ hot and failed. The one in distilled water heated the bowl up to around 40 degrees C (it was a while ago, so I can't remember the exact figure) but didn't fail or short out.

>>routines are used that are not available in either TOS and/or MagiC?

>I should say RTFM. It says that I works with MiNT and maybe with MagiC
>too but the latter hasn't been tested.
RTFM doesn't change a thing to the fact that it doesn't work with MagiC
and TOS, it never did...
But this is beside the point, the question was why something relatively
simple like a graphic shell needs MiNT. Not that long ago you had a go at
ASH because they released software that can only be used under MagiC. I
would say that the same applies here.
GuiTAR not working with MagiC doesn't bother me a bit, the Jinnee/Scripter
combination takes care of TAR and GZIP files very nicely, but its the TOS
users that are left in the cold by the MiNT community....

>Do you? Anyone objecting to a small amount of self-publicity in response
>to a question is welcome to post a message about it.
Yes I do. So that's posting number one... :-)

>There are much bigger self adds than mine.
Indeed, but except for Ben Smith his masterpieces, these self adds are from
people that have no commercial interest, you can call your postings whatever
you like, whenever "Keychange" is mentioned its SPAM...

>>Just suppose that all your colleagues would offer their "services" here as
>>well.
>
>Just who are you talking about? Go on, name them. Calling someone a
>colleague isn't actionable in the UK.
I'm talking of your collegues... you call yourself an Atari dealer and don't
have a clue of the competition?

>>If you really need to make publicity then you should do so in the suitable
>>media, but certainly not in CSAST.
>
>Says who? Do you and your mates run this group?.........
No, the RFC rules... and you better check them out, as it is, someone filing
a complaint against you could succeed in convincing your ISP to close your
account. We wouldn't want that, would we ?

>>Your "serious problem" with Steve is merely the fact that he advises
>>people to consider a well established dealer,
>
>No, matey, in my opinion he can have a runaway gob that don't know when to
>stop.
We *know* your opinion, you've aired it more then once. Several people here
don't agree with you.

>Got any more? I've been shakin' the tree for a month, no more fallen out so
>far....
That doesn't mean a thing. Perhaps you've been shaking the wrong tree ?

>As always, you miss the point, I would like to see complaints aired
>properly, not passed around thirdhand to a mouthpiece.
A complaint aired in computer.sys.atari.st.tech isn't exactly thirdhand
information being mouthpieced is it? IMO this is a perfect example of a

complaint aired properly but then ofcourse you disagree....

>More posts please.
Yes, let's shake the tree a little more...
After being "years" in the trade and having "only" one upset customer, who according to you only has himself to blame, surely there must be hundreds of *very* satisfied customers around ?
It's not the first time that someone complains about a dealer in this newsgroup, you know what usally happens? postings come flooding in from other people having a nasty experience, but there are *ALWAYS* a lot of postings of people writing the opposite, people who had a good/positive experience with the dealer that is criticised....
You've been shaking the tree for over a month, but I haven't seen a single bit of support for you or your business, very weird if you ask me...

Cheers from Belgium
Dennis

Date: 2001-02-25 04:07:24 UTC
From: puffpuffin@aol.com
Message-ID: <20010224230724.22450.00005606@ng-mq1.aol.com>
Source record: 49735

>>i just got a syquest drive 44meg and have the link....how do i go about
>>using this with a 1040?

Buy an external SCSI hard drive case (it should come with a power supply and a
50-pin IDC to 50-pin centronics cable).

Stick the Syquest into case and plug everything in. And then plug the Link
into the 50-pin centronics port and the 19-pin plug into the ACSI/DMA port on
the 1040.

Easy!

>I'm not sure that the Syquest provides TERMPWR which is absolutely
>required by the link, so you may have to hack the drive to provide this
>5V or the link will stay asleep.

All Syquests have the 5V connected. Only @#$%^& Iomega ZIP drives don't.

Whilst reliving childhood traumas, O_v spied Jeff Mitchell's 23 Feb 2001 message...

> ha! I didn't even run a BBS until I had 1200bps.. though I teruly
>loved the 300bps connection sound, I didn't dare run a system until I had
>the blazing power of 1200.

I ran Commodore BBS software that didn't support 1200 baud. I ran it at 300 and, when 1200 became affordable, tried to upgrade. To my surprise the software simply didn't operate. I even contacted the author who said he knew about the problem but wasn't really in a position to fix it.

Sigh. I really liked that FRP BBS.

But could you list the contents of a gzipped tar archive? Wouldn't this
require an inital ungzipping before the archive contents might be read?

Telnetting to Amiga BBSes is easy, no emulation required. You just create
another node which uses any device such as telser.device instead of the usual
serial.device.

Yes, but you feed the output of gzip directly to tar. No inbetween storage
of the data is needed. If the decode routines are well written the biggest
timeconsumer will be writing the output to the screen on Atari like
computers (unless the archive contains some very big files).

Hans Wessels

The original Acorn mice are similar to Atari mice, except for a middle button and a 9 pin mini-din connector instead of the Atari-type mouse connector. I suppose that if the mini-din connector was removed and replaced with a normal Atari-type connector, they could be used on an Atari or Amiga. Whether someone would got to such effort is another matter, especially with the location of the mouse ports on Atari machines.

Regards,
David Bolt

Thanks heaven for that.:-))

>Computers are invented to be convenient to their users, not the other way around.
>The text IO approach of Unix is intented to be used by operators.
>Modern home computer users are not operators. I am not a operator.

In a certain degree I'm agree with you. If there are GEM equivalents
available I usely use then instead of the text based ones but my point was
that I can't understand why people have soo much trouble to use Gzip and
Tar. It's very easy. They only must read the docs. But this is something
people don't want to do anymore.

I'm surely not an operator myself. I even hardly understand the way MiNT
works but at least I doing my best to learn the basic stuff and I must
say I enjoy that.
Recently I've bought for my son a second hand Mac G3. There is no fun at
all on that machine. Everything gets installed by installers etc. The
machine rules you. I prefer the other way around, I dictating the
machine what to do. I guess that's why I love soo much MiNT.

>Programmers holding on to text IO, are not skilled enough, or just too lazy.

Hmm, I'm not a programmer so I don't know if you've a point here.

It is useful to read and understand the posts before typing.
I said "enough conduction at 5 volts to cause the devastation you wrote
about"
Are you really going to try and dignify Steve Sweets remark. I think not.

> Until I got around to cleaning my Dell keyboard. It had a cardboard
> liner - this, despite being apparently dry, retained enough moisture to
> cause the keyboard to fail even after 48 hours in the airing cupboard.
> Removing it entirely cured the problem.

Which electrical type of keyboard you seem to have omitted. If it was
an old Dell one then the chances are it used an inductive system
with a ferrite going through a hole in the pcb to detect a key press. I
agree
that any system working on inductive loops is subscipicale to moisture but
unfortunately a ram upgrade running at a low frequency and relatively
high switching currents would not be affected.

For the hell of it I'll moisten the bottom of my Marpet ram board
and run Gembench for a day. I know it will work fine and with the
heat developed by the machine it will be dry in no time.

FamilyNet Newsgate

Hello Mark!

MG> I remember the Marpet Ram board having cardboard on
> the base to insulate from the metal shield. As you
> say your machine worked fine afterwards so do you
> agree that the insulator must have worked.

This was a long time ago. All I can say is that whatever measures were taken by the manufacturer or myself seemed adequate.

MG> I see from your cut and pasting below that you may
> have taken my post out context.

My software doesn't have 'cut and pasting', I edit each message by hand.

MG> My posting wasn't against Marpet or yourself...

Understood.

FamilyNet Newsgate

Hello Henk!

HR> I typed my first commandline in 1976. On a mainframe
> running a OS that was immensely more spophisticated
> than Unix.

Note that 'Spophisticated' doesn't necessarily mean better,
just more complex.

HR> Nevertheless I was bored immediately.

Short attention span?

HR> Before that I punched my commands in cards. Once
> punched, these cards could be used over and over
> again.

Yes, that's how punched cards work.

HR> I left the pro scene in 1883.
^^^^
Wow, a real old-timer! <grin>

HR> If a program isnt GEM, it is not for me.

That's fair enough, people's tastes vary. I always thought
GEM made an excellent file manager, and a comfortable
graphical environment. I can use either a command line or a
GUI, and I use whichever is the more convenient to get the
job done (not always the GUI).

HR> Computers are invented to be convenient to their
> users, not the other way around.

Computers are tools. To be effective, they should be easy
to use. That doesn't always necessitate a GUI, but in my
view the Atari machines benefit greatly from the inclusion
of GEM.

HR> Programmers holding on to text IO, are not skilled
> enough, or just too lazy.

I had to edit my reply, because my initial response to this
wasn't suitable for a public newsgroup. Suffice to say that
I disagree in the strongest terms. For many applications a
straight textual interface is the most flexible and
efficient way to get the job done. There are also many,

many applications where a graphical user interface is not
available.

- Andy Ball.

Steve,
No. If the MTU is 1500 (set in the Dialer) then MSS in Sting's
Default.cfg should be 40 less than that MTU (MSS would = 1460 in this
example).

Hi

Just d/l Sound Studio V2 off chapelie and I'm extremely impressed, just what I've been looking for. Un fortunatly it's quite buggy, and so quite unusable.

I'm running Fpatch, FDI-Init and NVDI under TOS. Altering the order of these auto prg's or romving any doesn't help. Would getting an FPU help to run Sound Studio?

Basically when I go to menus it will lock up the machine, with accelerator on or off. I do have a clock patch, but it's not very good. Does this seem like the symptons? This is running from a 2.5" IDE.

Thanks, I just love the DSP effects, and yet to try out the timeline due to this.

I have not worked with modem initializations for years and no longer have the skill to make specific recommendations. It sounds like you are connecting with a different modem, which may require a change to your init string. You may want to check with you ISP for recommended inits to try.

What impresses me with you Barrie is that in all the time of my Atari owning, all the main players never showed up on here to generate interest, or gain extra business I think I have only ever seen you and Chris Crosskey answering questions

Systems Solutions or the " Atari workshop" in my opinion are a waste of time and I feel they play on the fact that many people think they are the only company who can supply or repair Atari products, also the name implies a connection with Atari itself witch no longer even exists

Why don't you all use Two-In-One, if you don't like command lines? The documentation explains how to set it up for the archive formats it doesn't handle internally. You just have to make sure the archives and tar.ttp and gzip.ttp are in the same folder. The command line for tar is -xvzf $F. The rest is self-explanatory.

Guitar itself seems to work under MagiC, only unpacking seems not to work.
Under MagiCMac I get a warning "can't open output pipe" or something like
this, just before MagiC dies with "Speicherblock durch benutzerprogramm
zerstï¿½rt"

>But this is beside the point, the question was why something relatively
>simple like a graphic shell needs MiNT. Not that long ago you had a go at
>ASH because they released software that can only be used under MagiC. I
>would say that the same applies here.

As said the GUI itself doesn't need MiNT.
Yep I've said that and I'm still saying it. The programmer of Guitar and
the most other programmers do their best to make it running under MagIC
which can't be said at all of some MagiC programmers.
Everytime a nice GEM prog sees the light that doesn't work very well under
MagiC it rains complaints but o jee if other complaints about MagiC-only
programs

>GuiTAR not working with MagiC doesn't bother me a bit, the Jinnee/Scripter
>combination takes care of TAR and GZIP files very nicely, but its the TOS
>users that are left in the cold by the MiNT community....

Are you sure of that? I won't stake my head on it. It surely doesn't work
with MiNT/Jinnee/scripter and it seems not to work under magiCMac too.
IMHO a TOS user doesn't need TAR and GZIP at all. Furthermore TOS users
are left in the cold by almost every programmer nowadays. Have you tried
to use for instance Mymail or Luna under plain TOS? It's about time
programmers lets go TOS. TOS is dead. I haven't use plain TOS since 1995.

A very nice posting indeed.
I endorse fully what you have said.

My impression was that they were always up themselves just like certain
people on this group.

May I take it then that your previous posting implied a certain
London based company?

>other people having a nasty experience, but there are *ALWAYS* a lot of
>postings of people writing the opposite, people who had a good/positive
>experience with the dealer that is criticised....

Yes people will always jump on the Band Wagon and will ignore those
who disagree.

>You've been shaking the tree for over a month, but I haven't seen a single
>bit of support for you or your business, very weird if you ask me...

This last sentence backs up entirely what I have just said.There is
nothing weird at all.I have read at least 2 support mails and these
do not include the 3 from me. Incidently 1 of which was acknowledged
by Mr Sweet. So Dennis it would appear that you are either not
reading threads correctly or are not getting all the messages.Funny
the missing ones should be with views opposite to yours.

Strange, I have never had the occasion to see ST-Zip misbehave so badly.
I KNOW it not ideal and has some bugs- a limit on the number of files in
the root directory, then something about renaming files in the archive, etc.
Respecting this, it seems more-less ok. Could it be, in the above case, that
the archive was corrupted and ST-Zip could not handle it. Occasionaly i have
had to use Infozip's zip/unzip for partial salvation of a corrupted archive.

True, but this does not answer the above question. Why is it so essential
for it to use a multitasking OS when all other archivers and shells can do
without one.

>so..
>I really don't get it why people are so struggling with tar and gzip. It's

I am not struggling with them. I can use them and use them when I have to.
What I am complaining above is the needless requirements for large resources
that this particular GuiTar has.

It had GESOFT software hard driver - I take it that's the one you
mean?
I like personally prefer the options available with HDDriver - TOS/DOS
partitions, Zip drive support etc.

>The last time it arrived here, according to my *notes*,
Not on cardboard by any chance?

>the case had been opened and the rear panel was damaged. I
reformatted it, connected the I.D. >switch and returned it in full

Very "interesting" account this, as I sent the package by registered
post and it was _never_ opened by anyone except yourself. The drive
was checked and packed with your own packaging both by myself, and my
mum, who as it happens was a post office counter clerk at the time.
Indeed the drive was photographed at the time as proof of condition
too. Any damage should have been reported straight away so it could
have been reported to the post office immediately.

No it wasn't corrupted. I could extract it without any problems with
unzip 5.40 (MiNT version). I don't remember the details but it was a
selfextracting zip file (tos).

>
> Could you talk English this time! I honestly can't understand all
> this stuff about subnet mask and all that. How do I make a class A
> network if there is such a thing.

If you're making a private network it could
be class A, B or C. Doesn't matter.

The IP addressing scheme is hierarchical
and contains two important fields within
the 32-bit number (which is written in
dotted decimal form xxx.xxx.xxx.xxx just
to make it easier for humans to manage)

1. Network address (unique identifier for
each network on the internet)
2. Host address (unique identifier for each
workstation within a network)

Fig 1: Class = first octect (left-most)

A = 1-126
B = 127-191
C = 192-254

Fig. 2: Division of octects between (N)etwork
and (H)ost address fields

A = N.H.H.H
B = N.N.H.H
C = N.N.N.H

The subnet mask simply filters out the
network address from the host address.
Thus:

192.168.0.1 is 11000000.10101000.00000000.00000001
255.255.255.0 is 11111111.11111111.11111111.00000000

If you logically AND the two binary numbers
(hence mask, remember the computer sees
everything as binary), the last octect (right-most)
of the IP address gets masked out, so you know
the first three octects are the network number.

You might assume from Fig. 2 that you can
tell simply from the class, which octects are
the network address and which are host, but
there's a further (optional) sub-division of the
IP address space.

Within the host octects, you can "borrow"
bits to extend the network address and
create a sub-network (subnet). Therefore,
a subnet mask of 255.255.255.240 (in binary
below) will tell you that the network address
is actually the left-most 28 bits, not 24 as
would be the case with a plain vanilla class C:
11111111.11111111.11111111.11110000

Good evening Atari world,
I'm looking for a home accounts program
that will run under MagIc. I am currently using Home Accounts 2 but this
will only run in Med res TOS and is quite inconvenient to say the least.
It would be fantastic if there were a more up to date program out there
somewhere and... if it would import Quicken *.QIF files that would be even
better. Can't hope for too much though ;)

Help appreciated as always

Nope, it's a 1999 model with switches. I didn't strip it down completely
to see if it uses rubber cups or microswitches, but it's definitely not
an inductive system.

Interesting. I have never had a problem with it (these days I am using ZIP.JR from the 2-in-1 shell) depacking files up 3.5 MB at least. I use it when posting to PC users as I am not sure they can use LZH (which I normally prefer).

Thanks for that - it cleared things up a bit for me. I agree, the
original docs I reaad (a long time ago) didn't mean much to me at the
time - I know a little more now, but still struggle with some command
line programs...

>Or even better, use GEM for what it was invented for, and what Atari's are
>supposed to be known for. Make graphical shells for all these so it's more

Fully agree. I wonder whether it would be possible to include tar and gz
in the slots of 2-in-1? Unfortunately all of mine are in use :-(

> We just don't have time in our busy schedules to read through
>long, cryptic online manuals that give us too much technical info and not
>enough clarity.

Hear hear. I try in my manual translations to make sure that the context
is clear, often adding a para or two as explanation. Makes translation
very slow and hard work :-(

Ah, different kinds of spam then, those that agree with you and those that
don't....

> I'm talking of your collegues... you call yourself an Atari dealer and
don't
> have a clue of the competition?

Oh dear! This point has been answered, I think.

> >Says who? Do you and your mates run this group?.....
> No, the RFC rules... and you better check them out, as it is, someone
filing
> a complaint against you could succeed in convincing your ISP to close your
> account. We wouldn't want that, would we ?

Give it a try, matey.

> We *know* your opinion, you've aired it more then once. Several people
here
> don't agree with you.

T'would appear several do agree, too. How many threads have you read
properly?

> A complaint aired in computer.sys.atari.st.tech isn't exactly thirdhand
> information being mouthpieced is it?

If posted by other than the customer it must be at least second hand.

>IMO this is a perfect example of a
> complaint aired properly but then ofcourse you disagree....

Not at all. Leaving aside the fact Barbieris' ' complaint ' is the only one
to
be posted, he makes claims he is unable to prove so far and people
like you and your mates seem to see/believe only the complaint
and ignore the replies.

Like I said, how many threads do you have?
>
> >More posts please.

> Yes, let's shake the tree a little more...

Okely diddly dokely, for as long as you wish.

> After being "years" in the trade.....

From 1994.

> and having "only" one upset customer, who according to you only has
himself to blame,

No, matey, I've " upset " many people. Selling Cubase v3.1 for £149
brand new, when others were asking £250 " endeared " me to a few people,
refusing to sell it any cheaper was a real downer for some , as well.
Marking my components so they can't be switched really caused an " upset " ,
too.

> surely there must be hundreds of *very* satisfied customers around ?

There are.

> It's not the first time that someone complains about a dealer in this
> newsgroup, you know what usally happens? postings come flooding in from
> other people having a nasty experience, but there are *ALWAYS* a lot of
> postings of people writing the opposite, people who had a good/positive
> experience with the dealer that is criticised....

Hardly a flood this time but very I'm pleased this topic has been of
interest to some.

> You've been shaking the tree for over a month, but I haven't seen a single
> bit of support for you or your business, very weird if you ask me...

Point answered by others, if you received the thread.

Total threads received so far is 49.

Barrie at Keychange.

I was referring to Acopy. Anyway I think Blitz Turbo was just a fast
disk copier, where as Synchro Express was a track by track style
copier, meaning it made an exact copy. I could be wrong though about
the Syncro Express.

receipt,

? As far as I'm concerned (and have said before) I have no interest in
having anything more to do with you - I've wasted more than enough of
my valuable time trying to reason with you as it is. I would have been
more than willing to supply anything - the 2+ years ago I had the
misfortune to deal with you but now? I don't care to use your
"Business" and the time I could have gotten any damages from the post
office are long since gone thanks again to your ineptitude - How that
doesn't surprise me!

If you read all posts from both threads concerned you will the only
reason I offered my story was because *you* were asking for ppl to
come forward - and were attacking Steve for no reason. In this thread
you started calling me childish names.

That about sums you up.

Sean

Why do people you have never met resort to personal insults?

When I despatch a hard drive it is set up as the customer has ordered.

Answer me this, matey.

If the customer subsequently purchases software and manages to corrupt the
drive,
as in Barbieris' case, where should he go for help, to the drive supplier or
the software supplier?
Conflict of interests.

No stupid comments!

Barrie at Keychange.

Hi Thomas

If it always happen after 30-45 min use, my bet would be,
overheating. If you have installed any extra cards in your Falcon,
then it's very likely.

>Err, I can't get on with Telstar. Say's Busy then it says BBS hangup
>or something like that, oh yeah with no carrier. I'll try another
>telnet prog if that helps.

Most BBS' are single-user -- they were a computer with a phone
line and a modem. I think all Atari ST BBS' were single user, though
several IBM ones were multi user. BBS Express ST was single user, meaning
it can only do one person at a time. As such, if someone else is on it,
you'd get a busy dial tone when you dialed amodem, and as such the
emulator feeds you a BUSY and hangs up. I cannot do multi person unelss I
rewrite significant portions of the BBS.. and since no source, I can't do
that, either. (I'd buy the source, but god knows where Rich Sanchez is...)

So you'll just have to try again later :)

I'd heard that, actually. But do many vt100 and vt102 terminals
support this mode? (most are vt102, since its the root of ANSI, and
xterminals and such support in inherently). I'll investigate a bit.. but
it shouldn't take more than a couple of days to work ou a VT52<->VT102
translation table for my serial client..

jeff

More improtantly I need to figure out how to speed up the serial
throughput..

2886. Atari (or 68000) disassembler?

Newsgroup: comp.sys.atari.st

Not much of that going on;-). Soon you will be buying Kiwi and Aussie meat again....watch the yanks tho, they don't like imported meat anymore. We sent John Howard (aussie PM) to the US to sort it out, but he came back. He said "sorry, Billy Clinton thort I was a bald fool and told me to bugger off". Do you want him?

Seems there has been alot of bitching going on. Gone are the days when The world was encapsulated in free love. I have turned on outlooks spell checker to avoid pissing anybody else off. Just for the record no one person using this news groups is right, but collectively we should be able to deduce the truth. I don't hold grudges against people who have a go if it deserved, but I think fairness has definitely gone awol around here. We need to stop moaning and fix all these SCSI and Cab problems methinks;-)

Thanks to those that have responded.
But the problem still remains.

Some have mentioned that I may need to edit my modem string.

I will probably try this, but I really don't think this is the trouble.

It may have something to do with the phone company and the way I am getting routed to the new numbers.

Also, there is one ISP in my Area that is Windoze only!
They don't provide a normal login prompt.
From what I have been told, this ISP waits for some type of data from Windoze's built in Net software before anytype of Login procedure is provided.
Even Mac's can't use this ISP!!

Has anyone heard of this before?

I ask my ISP if they were switching over to this and they said no and that they had alot of MAC users. I think that a Windoze only ISP is a form of discrimination.

This area is infamous for Civil Rights Violations and the like but thats a different story! ;)

Anyway, I'm still open to suggestions on what could be wrong on the ISP's end that would prevent my modem from making a connection to their modem system.

Thanks,
phantomm@eastky.net

Just a thought, but try using a RGB monitor if you haven't already.
Also, if possible try a different VGA monitor.
If it still doesn't work, then start looking hard at the Eclipse
for proper installation.

I have a few disk based Copiers here but have never used them.
ProCopy and A-Copier. Are these any good?

I have a Blitz cable and have used the Blitz and Blitz Turbo Software on
a 4meg 1040STE TOS 1.62 and it does a good job, but I have some game software
that it will not backup. I think that good drive mechs are a must when making
personal software backups.

Also have a Discovery Cartridge which does a good job, but it can be a bit
slow, but has lots of options for backups.

I have a device here called Switch Back that connects to the Printer port with
a Pass Thru for your printer, that suppose to allow backups of any software
that is in Memory to a disk file or Image. I've not used it enough to know
how good it is. It also allows you to run multiple copies of the same program
and switch back to any place or time in a program by pressing a button.
This works well with games, if you make a mistake then you can press the button
and switch back to were you formally saved your position in the program and
try again as many times as you like. This is all done in Memory.

BTW, I have the Commercial or Registered Version of FASTCOPY PRO. This is my
favorite disk copier and formatter. But it tends to bomb on the Falcon.
Does anyone use FastCopy Pro on a Falcon without any problems?
If so, let me know what version you are running. I may have a conflict with
an ACC or AUTO program or something.

What a bunch of dickheads. I haven't read so much uninformed overopinionated crap in my life. Period. It is a pity we can't get this bunch of morons to stop upgrading for a minute, check their history books, and realise they are only running fast 8bit dos box's. I would love to sneak in there and remove their hard drives replace their 1.44's with 5 and a quarters, and put mono graphics cards in their PC's. Far as I can see anything with windows on it should be considered a joke.......

Mark

2899. Is re-seating the ST chips a regular occurrence?

Newsgroup: comp.sys.atari.st
Date: 2001-02-26 06:27:33 UTC
From: Richard <richard.mcgorman.spamfree@home.com>

I've had a 520ST since 1986. It periodically stop working ever few years and I have to re-seat the chips in order to get it working again. Is this a common occurrence for others? I've never heard of this problems with other computers built in the mid to late 80's.

Thanks.

You just send the drive out with it set up partition wise but if
anything goes wrong or indeed a customer wants to change his setup
they are stuck especially if they are new to hard drives. There is no
hardriver utility included or manual (in my case at any rate) so is it
any wonder ppl find it difficult to trouble shoot. Luckily, after
purchasing the other working drive from system solutions I was in a
position to try to fault find as I purchased HDDriver at the same time
with manual etc. But in the end had to keep sending the thing back as
you seem reluctant to give anyone the benefit of your vast experience.

> If the customer subsequently purchases software and manages to
corrupt the
> drive,
> as in Barbieris' case, where should he go for help, to the drive
supplier or
> the software supplier?

If the drive had been working fine initially I would totally agreebut
as it wasn't.... In any case you, among the times I sent it back you
had to replace the actual drive twice due to it not spinning up at
all - this you said was a drive failure so not software specific in
any case. On the final receipt after a day it did the same thing and I
decided to give up due to the costs involved in carridge/insurance
etc.

There were some legitimate gripes in there. Apparently one guy had a membrane keyboard Atari 400. Other complaints ranged from slow cassette to a stock 1200XL. I like the 1200XL best of all my Ataris, but I don't use a stock one. Memory expansion, multiple OS, built in BASIC, that kind of stuff.

http://user.tninet.se/~jyc891w/software/html2txt/

HTML2TXT: TechTV | The Worst Computers of All Time
==========
The votes are in.

A few weeks ago we asked you to tell us about your crappiest computer. Within hours, our inboxes were overflowing with tales of PC nightmares. Using highly scientific vote-counting methods that rival those of Palm Beach, Florida, we examined both dangling and pregnant chads and finally compiled the list of the worst computers of all time.

Before we get to the losers (or are they winners?), I want to quote Robert Swyter and Carl Cabe who made the following reflective comments about crappy computers:

Robert writes, "There's one thing most people are forgetting. Even the crappiest computer at one time was the best and fastest -- just because now the speed can be blown away by your digital watch doesn't mean the computer didn't have its merits, or its day in the sun."

Carl takes the capitalist approach. "My crappiest computer is the one I now own," he writes, "soon to be replaced by my next computer, which will then become my crappiest, thus justifying my next purchase."

Truer words were never spoken, Robert and Carl. Now, let's get to the list.

The 10 worst computers of all time

1. Compaq Presario
2. Tandy Sensation or Tandy TRS-80
3. Gateway
4. IBM Aptiva
5. Packard Bell (a.k.a. Packard Hell and Smacker Bell)
6. Apple (specifically the Apple II & the IMac)
7. Atari
8. Commodore 64
9. Texas Instruments
10. Micron

Why? If my favourite dealer <insert name here> was being dragged through the mud I'd be the first to support him.

My take on this is that the people who DO have legitimate cause for complaint are no longer ABLE to make their complaints known, and the reasons for that are legion.

Yes, this is normal - it's the quality of the used sockets.

Take out the chips, clean the pins with a fiber-glass pen, and carefully
pull inwards the pins on the PLCC sockets a bit, then re-seat the chips -
this should give you a longer time until the next service is required.

>mistaken here.

Yes indeed. I'm not a programmer but I wouldn't dream of changing MiNT for anything else. MiNT is somewhat complicated if you want a fully-fledged MiNT system with acces rigths, multi-user support, MiNT-Net and the like. If not, N_AES comes with GEM-Setup, which installs a MultiTOS-like OS. It's just a matter of clicking on the "Install" button. I guess it's no more difficult to install than MagiC. The thing everyone seems (or likes) to forget about MiNT is that you can do almost anything you want with it -- configuration-wise, I mean: mono-user/singletasking, mono-user/multitasking, multi-user/multitasking.

I like the Indian dude who says his old Gateway is crappy 'cause he
downloaded three viruses on it! I think that the Gateway, Micron, TX
Instr.(only because of it's initial $1000- price tag), and Packy Bell all
absolutley belong there! YEAH! I find it interesting that most of the
complaints do seem somewhat educated and informed, almost as if they read
this newsgroup. I think we may have traiters in our midst!

well i suppose the real crud of the 8 bit days have realy been forgotten.

Matel Aquarius anyone? out dated, over priced and under spec when it
arrived. No one bought them. Now shifting for £150 mint in box!

Sword M5, same issues.

I mean if your going to release a rubber keyboarded sub 16k ram machine,
don't do so when the spectrum 48k and C64 are long established and involved
in a price war :)

Over here in the UK you had the C64, Sinclair Spectrum, Amstrad CPC,
Acorn/BBC and Atari here in the UK. All else failed. Even then Atari thought
was always a bubbler, struggling to hold on to 4th or 5th position.

You should have seen some of the other pretenders, Brave tries like the
oric, or mythical beasties like the enterprise/whatever they called it in
the end, through to jokes like the aquarius! Now there was real crud :)

Hallo Jean-Francois,

JFL>Why don't you all use Two-In-One, if you don't like command lines?
I do not dislike commandlines. Sometimes, especially when
decompressing a lot of archives that have all about the same name, I
find it easier to use a command line.

And the TAR I was talking of only needs one command to decompress a
TGZ file:

tar -xvZf file.tgz

But there are TGZ files (from some UNIX systems) that urge the user
to create folders manually though most of them may be unTARed
automatically.

I often use a BASH-like shell running on TOS...

Well, I did finally get it behaving most of the time, but someone saw one of my adverts for it, and I decided to move to a Cubase VST system - not a conventional PC, however ;)

Everyone who has helped, it's much appreciated (and I need your address Lyndon!). I'll probably get another Falcon in time, but as a 'home computer' like my 800XL/65XE etc, rather than trying to make it something quite as critical.

It's replacement, hopefully in April or May, will be a custom-designed PC system called the Carillon AC-1 - a rackmounted PIII designed specifically to run music applications, and with a special alloy case and silent fans/HD etc. It's actually cheaper than a dedicated hard disc recorder!

I'm still going to stick around and keep an eye out for a cheap MegaST/e system, just in case the PC MIDI implementation gets interesting ;)

Richard

Like you I doubt it's the init string. It could be the phone company.
The Ascend is a very good probability though. Have your ISP check if
there are any announcements or advisories about the new hardware they are
installing. You are using a Hayes modem that may not properly talk to it
unless they turn a switch on in the software configuration. I have seen
this before.

>
>Also, there is one ISP in my Area that is Windoze only!

>Even Mac's can't use this ISP!!
>
>Has anyone heard of this before?
>

I haven't heard of this, but it wouldn't surprise me. However
luckily, most windows coders can't anymore. It's very likely that if you
have a TCP/IP stack that does an active negotiation that it will continue
to work with it. I complained to my ISP about a software change they made
once. It made it so that I had to connect 3 or 4 times before I got a
good connection, it turned out that they had installed this software 10
months prior and it just hadn't started working reliably til recently.
They went in and checked it and discovered that it was misconfigured.
But back to the first topic, if you have an active negotiation (STiK does
this, I'm sure MiNT Net can be told to do it if it doesn't by default, and
I would be surprised if STiNG didn't do it) you will probably cause the
ISP to flip over and negotiate the connection for you. By active, I mean
the following. Most of the time people wait for the remote end to send
you data and then you reply to it until your connection is estabilished.
There is the second path though, that is documented in the RFC where you
request the info from the ISP and they reply to you. It's a different
path through the state machine, but it works. I can only speak for STiK2

obviously, but with it, it waits for the remote to speak to it and if it doesn't in a set amount of time, it initiates the negotiation itself with the ISP.

>I ask my ISP if they were switching over to this and they said no and that

>system.
>
>Thanks,
>phantomm@eastky.net

As I said in the first part have them check on an service announcements about their equipment. It's possible that it will not accept connections from your modem until they reconfigure it. Since you have a Hayes 56k modem, they shouldn't complain that you are using a crappy modem.

Hi all,

I've uploaded STonX 0.6.7.3 on Source Forge and I was
trying to compile it on a latest x86 Debian Linux distribution.
And I have some problems. It fails at "configure" and "make"
passes, because the SVGALib doesn't seem to be installed.
I'm not root on the system, so I can't install any
package, unless on my home directory. I tried to
find "vga.h" "vgakeyboard.h" and all those other stuff
on the system, but there's none of them (they are
included in the "svga.c" source file). Is there a
manner to configure without SVGALib, or installing
SVGALib package, keeping in mind that I'm not root ?

Thanks for help,

Regards,

Hi Martin,

>It's very easy. They only must read the docs. But this is something
>people don't want to do anymore.

Not true. I used to use the command line to unpack Mint stuff when I needed to, and I worked it out by hand, by reading the manual. But the manual was written so badly it took me 1-2 hours to get the hang of it. The manual confuses the reader with stuff you don't need to know at a basic level. Maybe I d/l an old version of tar/gzip but all the docs I read on Mint are this way. This is what keeps me away from the Mint world, I mean, look at GCC's documentation!

500Mhz Celeron, pig slow, I checked and I was getting a peak transfer
rate from the server for internet browsing of 500 bytes a second :)

That's good, thanks. I may do my old system though with a folder in
the root of the partition, then folders in there holding each type of
graphics/sound. I used to have so many different file formats, it
would clutter the root directory up too much.

The problem with this particular 'poll' is that by definition it will
attract the biggest complainers. It's _designed_ to lure all those
morons who have utterly no computer savvy to go and complain about the
machines they once owned. I'd be willing to wager that if they'd come
out with the 10 best computers, you'd see some of the same names on
that list, 'cos everyone has their own personal opinion and slant on
the various machines that have been available throughout the years.
Put up a 10 best list and I'd bet you'd have plenty of Commodore and
Atari faithfuls who'd come round and push it up near the top, so
really, that 10 worst list is utterly no indication of which machine
was really worse, 'cos it's completely subjective.

Okay, _no_one_ will probably ever admit that Compaq computers were
ever good, but that's a given. :-)

>find any.
Yes, EPSON-GDPS driver 2.2, it's a German program but unfortunately doesn't
work on a Falcon. It works fine on a TT or the ST-line using a LINK97...

I've no idea where you can download it from... I'm busy translating the
program and docs which will be put on the DDP website once finished.
If in the mean time anyone would like the German version, just mail me.

Cheers from Belgium

>then.. I was still a dumb kid. But by the by when HST came out (what was
>it, 9600HST, 2400bps normal?) things really got fun..

I had a quasi-part time BBS at 300 for a while -- on FoReM XMDL, my
own modified version of FoReM XM that had some nifty features -- like
built-in downloading from message bases (pseudo-file attachments) a
few built-in online games (simple stuff like Blackjack) and some other
things. I had some trouble with it tho 'cos I kept running out of
BASIC RAM, so I kept having to eliminate things or make the code
smaller somehow in order to fit it all in. That was always fun... :-)

I remember the HST days. I always disliked USR for that -- coming out
with non-standard speeds that were only compatible with other USR
modems. Mind you I did have a 9600 HST for a while when I had my ST.
I then switched to a Hayes 9600, followed by an ATI 9600 ETC/e -- I
liked that one 'cos it had buttons which, while mostly useless, still
made the modem look neat. :-) I never did run a BBS on my ST tho. I
was always too busy programming and doing artwork and stuff to really
bother.

> BBS is all set up now.. it still can crash in a number of ways (my
>emulation isn't perfect), but it seems pretty stable. Lots of games dont'

>does), Galactic Empires, and DDST working so far. For DDST I'll have to
>code a VT52->ANSI translator, or find a newer version that supports
>ansi/vt102 for todays terminals...

DDST! I remember that! I played SEE and GE a bit, but I really
preferred DDST. I was actually working on a few online games way
back. Hacker was one, which was based on a PC online game called BBS
Crash -- except mine was more advanced. I was also working on
Wasteland, an ST conversion of the PC online game of the same name.
Hacker was going along quite well; I'd almost gotten it finished, too.
Wasteland was only working to the point where I could walk around the
map and return to the main base. I wish I'd finished those...

Well said. The thing forgotten here is to devide the number of complaints by
the number of the computer sold. For 'Atari' you will have to add up all
different specimen of Atari ever sold. Then it will undoubtly rival the
Commodore for the first place of the least crappiets computer in history.

The Eclipse/RageII won't work on an Atari RGB monitor.
You need an SVGA capabable monitor of some kind.

>Also, if possible try a different VGA monitor.

I really doubt this is the problem.

>If it still doesn't work, then start looking hard at the Eclipse
>for proper installation.

If you get a picture at all, the installation is likely to be OK.
If the computer can't access the RageII card properly, it won't be able
to initialize it and nothing will appear on the screen.

>On 25 Feb 2001 21:54:11 , "Thomas Jordan" wrote:
>>Can any one help me in getting the eclipse card to work on my falcon.

Generally, the developers of a thing are the best equipped to do that.
If your problem is not purely a hardware one, which yours does not seem
to be, that would be me. ;-)

>>Unable to get a video picture, only a scrambled video signal.

Depending on what you mean by scrambled, I can think of two things:
- You're not using the PCI BIOS (it might not have been installed or there
might have been some problem at startup, or perhaps you forgot the
'pcibios' option to the device driver) and have not specified the size
of your cards memory as 4 Mbyte ('4mb' switch, but it is not needed if
running with the PCI BIOS).
- You might have configured a mode that your monitor can't handle.
Try 'mode 640x480x8@70 for something that any monitor should be able
to cope with.

Anyway, I think it would be better to continue with this via email.
Please, get in touch with me.

The Eclipse doesn't work with a RGB???!!!

I surely hope one can disable it with software if one needed to use an
RGB monitor. If not, I'd personally have no use for it.

Don't hide the solution to the problem, let us all know the fix. Just
in case we run into the same thing. :)

I kind of liked the theory one computer wag put out; "Any computer that could use a cassette for storage, and that includes the original IBM PC".

That was almost a valid argument. Modern age of computers didn't come about until the Amiga, Mac, PC/AT, ST.

IIRC my Marpet RAMboard had cardboard, but was fixed into place with
hot-melt glue. That's plastic and a pretty good insulator.

Hello Francois!

FlC> I've uploaded STonX 0.6.7.3 on Source Forge and I was
> trying to compile it on a latest x86 Debian Linux
> distribution.

I've been thinking about STonX just recently, and would like
to give it a try on NetBSD

FlC> And I have some problems. It fails at "configure" and
> "make" passes, because the SVGALib doesn't seem to be
> installed. I'm not root on the system, so I can't
> install any package, unless on my home directory. I
> tried to find "vga.h" "vgakeyboard.h" and all those
> other stuff on the system, but there's none of them
> (they are included in the "svga.c" source file).

I'm root here, so theoretically can install the necessary
libraries. I need SVGALib, vga.h, vgakeyboard.h (are these
last two part of SVGALib?) and what else? I would happily
give it a try.

FlC> Is there a manner to configure without SVGALib, or
> installing SVGALib package, keeping in mind that I'm
> not root ?

Perhaps it could be made to run under X, but I that may
require an awful lot of work. Is there no way you can talk
nicely to the machine's administrator and ask them to
install the necessary libraries, explaining what you want
them for?

FamilyNet Newsgate

Hello Jeff!

JM> But do many vt100 and vt102 terminals support this
> mode?

The terminals do, but whether the terminal /emulations/
will presumably depends upon how authentic they are.

JM> (most are vt102, since its the root of ANSI, and
> xterminals and such support in inherently).

My understanding is that ANSI actually pre-dates the VT100,
but it's true that many 'VT100ish' programs actually emulate
the VT102, which is basically VT100 with a couple of its
optional extras (including I think extra RAM for 132x24
mode).

JM> I'll investigate a bit.. but it shouldn't take more
> than a couple of days to work ou a VT52<->VT102
> translation table for my serial client..

It may be an idea to use VT100 instead, some 'VT100ish'
emulations may not support the VT102 extras. Good luck
with the programming.

Regards,
- Andy Ball.

2944. Using Microtek 600ZS with Atari

Newsgroup: comp.sys.atari.st
Date: 2001-02-26 19:28:03 UTC
From: chris.crosskey@metrics.co.uk
Message-ID: <609562B7721BD41187B400B0D020856035C76B@FILESERV>
Source record: 49573

Does anyone know if a Microtek 600ZS will work on an Atari?....I've tried to ask Nima but my mail doesnt' seem to get through very reliably.....it's a 300dpi scanner with 600dpi interpolation that uses 8-bits per colour for 24-bit 16.7million colours scanning, it also does greyscale and B/W....It was only ever released with Mac software, though there are Linux drivers for it under the SANE program, so I might be able to get it running under Debian via SANE and GIMP on my TT...I'm planning on getting Debian 68k to go on my TT now that it is no longer needed in my studio....

2945. ST/STE RAM UPGRADES

Newsgroup: comp.sys.atari.st
Date: 2001-02-26 19:31:59 UTC
From: phantomm@eastky.net
Message-ID: <97eavfdub1@nd.eastky.net>
Source record: 49575

There were various RAM upgrades made for the ST/STe that would allow more RAM than the Stock systems were made to use.

I've never used any of these Hardware Ram Upgrades in an ST or STE before and was wondering if the Ram upgrades were Hardware only, Or did they use some sort of software patch as well?

>Okay, the bolted-on joystick was a really stupid
>idea ... but it still _looked_ cool. :-)

Actually, it was a great idea for text editing :) It was very fast, and
light.

For games, most of the time you used a tiny adaptor and an Atari
joystick :)

Richard (there were few native games, though. Most were Spectrum ports,
sometimes with new music 'Nodes of Yesod' being a great tune with a
typical Spectrum game. There was a /great/ trailblazer clone, which on
the 128 used shaded graphics and wouldn't have looked out of place
running on an Amiga).

I don't know you (the dealer) or Sean (the customer), but since
you wish to have opinions I will say this.
Based on your behavior, which is very unbecoming of a
dealer, my advice would to be just let it go, unless you have some
desire to loose further business.

There have been other threads about other dealers, and how they
perform or rate, and never have I seen one go quite like this.
It's sad really, but hey up goes the thread count. :-P

>JLC>software doesn't change anything : both IBM drives aren't seen
>JLC>anymore.
>Make sure that HDDRIVER.PRG on the floppy disk is identical to
>HDDRIVER.SYS on your hard drive. You may copy the 'floppy version'
>onto the 'disk version'.

Well, I know that ï¿½errare humanum estï¿½, but :
1- I thoroughly read the _german_ manual of HDDRIVER _before_
starting any kind of installation ;
2- I've been using all my devices with HUSI (or CBHD) for many
years, without any problem that I couldn't solve ;
3- My SCSI chain is composed of
a- a Quantum VP32210 SCSI-2 HD at ID0
b- an IBM 0662S12 SCSI-2 HD at ID1
c- another IBM 0662S12 SCSI-2 HD at ID3
d- a Toshiba XM-5201TA3014 SCSI(-2?) CD-ROM at ID5
e- a Sony SDT-2000 miniDAT at ID4
4- The terminators are set on the Falcon motherboard _and_ on
the last device (SDT-2000) ;
5- I tried connecting only one IBM drive, and HDDRUTIL didn't
recognize it as well ;
6- For the short time I tried to use HDDRIVER, it stopped my
streamer (SDT-2000) working ;
7- I didn't hide any ID while using HDDRIVER ;
8- Going back to HUSHI makes all work fine again!!!!!!!
So, how could I check my Falcon, which I suspect to be faulty ?
Where could I find utilities to check it out ?
Thank you,

J.-Luc

For worst computers a lot of theose brands had some major market
share. I beleive I saw in an old copy of Family Computing I have from
the early 80's that Commodore owned 40% of the PC market around
1982-83 with Apple at second with 30% and Atari boasting at least
double digits itself in market share.

Seems that they sold a whole lot of these "horrible" computers. ;-)

news:GFgm6.255$HL4.3334@NewsReader...
> I seem to recall fixing the drive for free .....twice. Silly me.
>
There you go, senility really has taken hold here I think. When you keep saying that you replaced the drive twice - that is correct, but it was sent back for testing (and the last time to be returned for refund) 5 times all together - doh!
After all this time maybe you just omitted this from you "notes" as the other times was for testing or refund, but to remind you:

1. Drive run but get corrupted data and stalls frequently (you've set this up btw) after struggling with it - sent it back for you to test.

2. Drive displays same characteristics but runs for slightly longer than before before locking up on data transfers. Then finally stops spinning alltogether on boot up - which you said was just one of those things - sent back.

3. Drive runs for a while but similar problems as before. I now buy another drive from Sys Sol and that works without problems at all while yours doesn't - on it's own or connected to the Sys Sol drive. - sent back for you to test fully again.

4. Drive stops working altogether - not spinning up at all on boot up - Sent back and "replaced"

5. Still problems - so decided to change your drive to be SCSI ID1 rather than boot to try to help fault finding but find that the jumpers are not wired up! On questioning you about this you stated that it was up to you how you configured your drives and not me. On saying that I had bought a drive (and another Link 97) from System Solutions you hysterically complained because I had the audacity to use a different supplier! When I told you that I could choose whoever I wished you, in a typical show of petulance - all too apparent from this and the previous threads - said "send eveything back and I'll refund all your money". Drive packaged with Link 97 Adapter sent off recorded delivery and I awaited my refund.

After a couple of weeks or so and no response, on contacting you, you then decided that you were now _NOT_ going to refund my money after all and said that you only said that because you were "upset that I kept mentioning Sys Sol"! Only then you decided to come out with some rubish about the drive being opened and damaged. Having taken a photo of the drive before sending I knew it was in perfect cosmetic condition after it left here. Strangely, when asked why you didn't

report this immediately on receipt of the drive you had no answer......

The drive returned back without the Link 97 host adapter. On being questioned on this you stated you had sold it cause I already had another from Sys Sol! When I said I didn't want to sell it you said it was too late you had already sold it! This was the last time we spoke.

Needless to say the drive stopped spinning at all after a while and was duely resigned to the bin - and not as you said in a previous thread bought back (I have the case still here) - again your notes.....

Fairly disgusted with this sort service and fed up having to deal with you I gave up and spent my money with Sys Sol, ASP and TUS where I've never had any problems with anyone - Professional dealers.

> And what a wibbly-wobbly story it has turned out to be!
So if you compare my story to yours (and I know you are bound to disagree), Yours is the one which changes tack at all directions.

We can argue forever more if you like but maybe you should wait to see if anyone else comes forward now - so you can blame them for their own "misfortunes".

I think you are all sore loosers when it comes to crap machines. ;o)
Y
ou should ask anyone who lived in the 80's behind the iron curtain or at least in other socialistic country, like former YU or similar.
With import constraints protecting domestic NON-EXISTENT computer industry,
any of the bigger manufacturers who even considered a possibility of soldering a few resistors was suddenly "computer manufacturer".
It was not important if the thing actually works, all that mattered then was to have some box at the fares...
So, in order to be able to byu something with 8 Kb RAM, monochrome and self-compatible, one was forced to pay 2-3 times price of C64 or over 5 Spectrums 48K. As an insult to the injury, all those machines bared names of partisan heros (WW II stuff).

OTOH, like through all prohibitions, people were boiling mean stuff literally at home. I remember scraping the money from all my relatives just to be able to byu components for "Galaxy" (very cool model in ZX-81 class, but with no-nonsense keyboard, ingeniously small basic and MANY very effective expansions- all with complete schematics and 100% homebrewable, it some kind of was our local GPL licence). You would not believe it, but author says that over 30.000 PCB's were sold to people in very short time !
Other from many serious contenders was "Wolf", which was in QL class, only simpler, with intergrated Pascal compiler instead of SuperBasic, with better graphics and much faster. Interestingly enough, author had even developed PCB CAD software that ran on "Wolf" and with which later models were developed.
There were several very nice CP/M machines, even one with HD64180...

To be 100% honest, there were RARE exceptions even between bigger local names.

One of them (and IMHO ONLY) was our "Iskra", which had developed multi CPU modular VME machine (68000/68010, 80286 and later 386, I don't remember the 3rd CPU option, I think it was some VAX relative).
With serious graphics at that time (256 colours at 1k x 1k with graphics&math cop. for starters) it was something to drool on- i think it was y.82....

I still have in the cellar some color VGA class monitors, that were specially meant to be used on remote terminals on the machine full VGA graphic just for remote terminal wasn't half bad in y.82... Did I happened to mention that one of CPU's supported Unix ? Monitors were from Toshiba,

but housings were/are ultracool, since they were made somewhere in Italy
from special plastic that gave them distinct look and every other part on
the computer was from same material...

I'm persuading one of the monitors these days to work on my to-be-heavilly
rearanged QL with VGA output. After all those years in the cellar it still
looks and works as new...

Home Accounts 2 runs under MagiC in ST-high rez too, but not in, say,
640*480. Trying to do the latter gives me an 'ST High, ST Med Res, TT
High, TT Med Res Only' alert but if I reset resolution to 600*400 on my
VGA monitor with Nemesised Falcon it's fine and I use it for all my
accounts.

>It would be fantastic if there were a more up to date program out there

I did and it was cool the other day, my first BBS :)

It's kinda cool the way the page appears line by line.

There were no news, and I tried Galatic game but an error occured and
I was told to tell someone (probably you). Also when I wanted to exit
the BBS it was in a loop, repeatedly asking me if I want to put a
message for the next user. Is this normal?

I'll try again tonight, but don't know most of the commands to get
anywhere.

The equvilant to that message under TOS is two bombs from my
investigations. I get it quite often on my Falcon, more than my
trusty STe.

What do you mean by it not occuring on 4mb Falcon? What machine
did/does it occur on?

Hey? Where's the Athlon! Sorry not keen on the Pentium range, I
laugh when I see what they done to the architecture of the P4.
Bring on the AMD Hammer! Sounds very good though for the rest of the
machine though. So are you doing the audio side as well, or just
Midi? I thought you wanted Cakewalk.

>I'm still going to stick around and keep an eye out for a cheap MegaST/e
>system, just in case the PC MIDI implementation gets interesting ;)

Yes, Mega STe is one of the best Atari's and at one stage thinking of
getting one, as they're cheap, realiable and upgradable.

BTW, make sure the new owner takes care of that Falcon.

Maybe I'm wrong, but aren't the Eclipse cards basically just PCI adapters
and Nova cards just ISA adapters? They only have drivers for the graphics
cards at the moment, AFAIK. As the Eclipse is able to "daisy-chain" more PCI
slots than just the one, it would probably be easier just to get that and
write drivers for other PCI cards than to start from scratch with *both*
hardware and drivers. It'd be cool to eventually have a whole list of
different drivers available for things like other graphics cards, ethernet
cards, video capture cards, whatever-you-can-think-of cards, etc.

EXOS was the Enterprise's EXpandable OS. It allowed, straight out of the
box, multiprogramming, a super-structured BASIC that was almost up to
Pascal levels of structure, a built in WP. The only thing it lacked was
memory protection, so whilst you could have multiple BASIC/Machine Code
apps loaded, the data would be lost.

When you added the EXDOS unit, everything gained disk commands. It was a
fantastic machine, and deserved /far/ more success.

>I like my SX-64. Great little machine, but I miss the tape player for
>it, as I have few games on disk. Bought it for 20 pounds in '96 :)

The tape players are very easy to find :) Much easier than an SX-64 ;)

coughs Not an option. Don't like them much, anyway ;) I got burned by
a Cyrix, and now refuse to use anything but Intel for Windows
applications.

> Sorry not keen on the Pentium range, I
>laugh when I see what they done to the architecture of the P4.

Yes, so did I once I learned about it ;) That's why I'm getting a
PIII...

>Bring on the AMD Hammer! Sounds very good though for the rest of the
>machine though. So are you doing the audio side as well, or just
>Midi? I thought you wanted Cakewalk.

72 track Audio and MIDI. Cakewalk was on the list, until I saw the
Carillon. It ships with either Cubase VST or Logic at the basic level,
along with a balanced XLR Mic input on the front, special 'tape
transport' control panel (the rack case has five chunky, illuminated
buttons for recording etc), 32 MIDI channels as standard (which is
enough, if not the best solution for dealing with cantankerous Roland
gear, but my dream 128Channel interface is rather pricey ;)). The
keyboard even has Cubase shortcuts pre-printed on it!

For some very sparse info, check out http://www.carillondirect.com/

And yes, I'm going to use it for audio for a very simple reason. A
Roland VS1880, 18-track, dedicated audio recorder lists at ï¿½2,499, and
tends to sell for ï¿½1,800 or so street price. The Carillon AC-1 VST costs
ï¿½1,399, does 72 tracks, MIDI sequencing, and has a much nicer user
interface. Plus I get a rather neat computer into the deal, and it
rackmounts, saving space.

>Yes, Mega STe is one of the best Atari's and at one stage thinking of
>getting one, as they're cheap, realiable and upgradable.

nods My exact thinking.

>BTW, make sure the new owner takes care of that Falcon.

I'm sure he will. For what it's going for, it's hardly worth selling,
but I also treated myself to a PS2 at the weekend since my old PSX died,
and I do have to watch the cashflow ;)

Craps itself on most falcons as far as I know. I think it has some thing to do with caching. I had also heard that you should never use the hard drive utilities as it will make a mess. Never risked it. I use bitz copy on the falc, haven't tried it with CT2 yet tho.

In it's peak it got quite large doing upgrades for Amiga aswell as Atari.
The original company they worked for folded or something (based near me
in Harrogate) so Martin and Peter decided to carry it on. Most of the
designs
where done by an external guy. They just produced the boards.

Mark Gray

BTW This Atari group isn't too bad once reasonable posts start going around.
I only posted in the first place because a few bad apples thought they owned
it.

>If in the mean time anyone would like the German version, just mail me.

Is it still being developed? It'll be really nice if someone could
help them out with the Falcon problem.
All the other software drivers for scanners, or even HD's, work fine
on all the ST/TT/Falcon range, so why not on this particular driver.
Must be something quite simple I would guess.

Get the demo of Nima's site. Also check out the ATOS pages as they
have excellent pages on all scanner drivers produced. I have a strong
feeling the 600 is supported, not sure about the ZS bit though.

Software as well. I think it was to intialise the RAM and to sort out
where the video ram block is placed in RAM as TOS has some problem
with this. TOS 2.06 or Magic is required, not sure about Mint, I
guess it doesn't work if TOS is less than 2.06.

ISA specs are floating around the web for all the timing, but it's
doing the drivers that is the bigger problem I feel. ISA would be
easiest, good solution for Ethernet I feel.

snip

The AMD has as much to do with Cyrix as Intel does with AMD. The only reason Cyrix chips crap themselves is that they are commonly used with shitty mainboards with poor regulation and cooling. What happens is the CPU fan fails the regulators overheat and burn out. Either that or the regs are just not up to the job, depending on the model. This doesn't happen on good boards so much. Cheap Chinese crap is the reason for it. Look at boards like ASUS, Abit, gigabyte. Then add a decent fan and away you go. My file server at home is a CyrixMX 233, on a Shuttle board. This board is crap, I had to put fans on the regulators to keep it for burning out, hi shuiming;-). I sell only AMD these days they are faster cheaper and NOT intel (grins). Incedently due to the nature of new CPU's I have found that a few pII/III's and celerons (smellyron) are killing regs as well. Haven't had that with an AMD .... Yet.

Mark

The original Falcon video is still there, so you can ofcourse use your RGB monitor as usual. But you can't connect it to the Eclipse's SVGA graphics card.

I still don't know how only 3% gets atari in to 7th place. Since I have a bunch of those ol' systems I have to say the sinclar ZX81 is the crappiest but I still like playing with it. And as far as there Tandy/trs80 sounds pretty grey to me. I still use my M100 still to this day, and my 2500 SX and my 1000 tx. Can't be that crappy if there still being used. Mind you, you do get used to the membrain keyboard on the 400. And that was only used on the 400 because it was a starter system as little kids tend to have messy fingers.

Absolutely! It is called TT-... for the 030/881/2 support.
It runs fine on any ST, real or emulated.

You can disassemble 030 code on your ST. It doesnt matter.

Not sure of the correct english term - it is used as a special kind of
eraser on ink drawings, and consists of a bundle of thin glass fibres - they
are available around here quite cheap in shops that have stuff for graphics
people and/or technical drawings.

Be careful not to get any glass parts or dust at your skin or eyes.

cu

It depends.

Martin Wevelsiep's famous card allowed up to a total of 15.5MB of true
ST-RAM and did not require any additional software or TOS patches - but it
required a lot of soldering, and was not cheap. It is not available anymore.

Extensions that add Alternate RAM require a small driver to make the
additional memory known to TOS, and they require either TOS 2.06 or a Magic
kernel which has the Maddalt() call.

Thats why you have no problem. It becomes awkward when you are forced
to work the way you dont like.

> Recently I've bought for my son a second hand Mac G3. There is no fun at

>
These operating systems (Unix/X, Windows, etc) need installers because so much
is related to everything. This isnt the case with GEM, and that is why I like it.

> >Programmers holding on to text IO, are not skilled enough, or just too lazy.
>
> Hmm, I'm not a programmer so I don't know if you've a point here.

My statement was a little bit strong.
It is basically a question of preferences. If you are a GEM buff and a programmer,
you start with a GEM frame (which you might already have). You fill that frame
with your programs functionality.

If you start to write the programs fuctions first, you might be happy when they
work. You might fail to get so far as to implement the GEM part, and leave it.

That's quite interesting. Like just about everyone today, I own powerful PC, but my BEST years of computing were spent during the Atari period -- from the 400-800 series. They've got to be absolutely ill informed to post that info.

On Mon, 26 Feb 2001 17:24:10 GMT, "Hans Wessels"
<atari.h.wessels@atari.home.nl> drooled an embarassing wet spot in his
lap as he typed:

>Well said. The thing forgotten here is to devide the number of complaints by
>the number of the computer sold. For 'Atari' you will have to add up all
>different specimen of Atari ever sold. Then it will undoubtly rival the
>Commodore for the first place of the least crappiets computer in history.

Undoubtedly. When you aim a particular poll with a particular slant
at a particular crowd, you're obviously going to come out with a great
deal of response that favours the poll's slant, because that's what
they want, that's the demographic it's aimed at, and those are the
people that are going to do the voting. I could put up a poll asking
after the 10 worst Bond movies and get loads of response, in spite of
the fact that everyone knows that, by definition, there really _are_
no "bad" Bond movies; only ones that were better than others. It all
depends on what end of the scale you put the labels on.

A good way to look at that list, I think, is to take it, flip it
upside-down, and re-label it "10 best computers" ... that'd put Atari
at #3 which, if based on the market share that each computer commanded
during its reign, would be just about right. :-)

My point is that there are people for which the commandline is never a convenient way. People who dont like to be mocked for that, certainly not when they still know that by buying a ST, they made the right choice.

I see it the other way around. Without GEM, I wouldnt even have noticed there was actually a brand printed on the case. I wouldnt even have noticed that it wasnt a IBM PC. (I never touched a single key of a MS DOS computer in my life)

I wonder if there has ever been a ST without GEM available to the public.

But this is not a argument for a GEM user.
It sounds too much like flexible and efficient to the programmer.

> There are also many,
> many applications where a graphical user interface is not
> available.

GEM is available permanently on ATARI, you only have to write for it.

I agree, you don't have to be a vet to see the nags dead.

However, my point is that any _professional_ person would not
listen to just one side of a story and be so opinionated that they feel
their actions are justified. We all have opinions and sometimes we
speak or type without the full facts.
I for one have had enough of smart arse engineers who _think_
they are always right just because they _think_ they are better.
To be in possession of the facts is to know the truth. To be in
possession of one side is to be biased, any professional person
would not be caught out like that.

Granted, more common machines were much more expensive behind the
former iron curtain, but that's mainly because of government
regulations and policies regarding imported products. The former USSR
for example, was particularily strict on the importation of products,
applying massive levies to them to discourage people from buying
foriegn products and instead encouraging domestic purchases. After
all, communism was all about the people working for the betterment of
everyone, and wasn't too keen on the capitalist view of working for
the betterment of oneself.

>looks and works as new...

Well, it's sort of hard to include homebrew and extremely obscure
machines to that list because they were very much indigenous to a
particular, narrow region. Chances are, few if any who never lived
behind the former iron curtain have ever even heard of such machines.
The Sord M5, for example, was generally a machine found only in
France. The Panasonic X68000 was a Japanese machine. And I think the
only reason more people know about them now is because of emulation.
Heck, I think there are a lot of computers people would never have
known about had there been no emulators around to allow us to see and
play around with 'em. :-)

Hi Len,
All I can say is baseball bats.

BTW after mailing Dave at TUS his reply was that he never got involved
with software because that side of the market was tied up by a few dealers
who kept it a bit of a monopoly (I think he is more into hardware anyway).
He
implied that the tusdev website never did anything because he was working
on his next business that is still running on the web. I believe he is going

to
have a look at the group at the end of the week (I wonder if he will have a tale or 7 to tell).

I never had to re-seat any of the chips on my ST, but I had a
custom-built hard drive way back made from the guts of a Megafile that
I had to re-seat several times due to dust and oxydization. It's
still a common occurrence nonetheless.

>

It depends. Some people have problems with Syquests. I've had none with my 4 Syquests and others have had no problems with their's either. OTOH, I know people who have suffered the ZIP 'click of death'.

What I hate is the ZIP design. It doesn't have TERMPWR pin connected, only allows ID 5 and 6, no power switch and a non-standard 25-pin SCSI port. Royal pain for Atari and PC laptop users.

I better stop before a ZIP vs Syquest war starts up again....

sigh If we only lived in a world where people actually bought the better product...

(of course, then Ataris would rule... :-))

> Whats that exactly?

You write data on the ZIP, and after a while, you listen a "click" in the
ZIP drive.
It only mean you just lost 100 megabyte of worthwhile data... :'(

Two of my ZIP 100 cartdridge have been destroyed like this.

One while using my Parallel port ZIP drive on a PC.
The other using an integrated IDE ZIP drive on another PC that was connected
to a ethernet network. The ZIP driver does not check correctly if the ZIP
was
full, and it makes the cartridge "click".

Even a low level format cannot restore the cartridge. You simply throw it in
the nearest dust bin...

Dbug

PS: By the way I have a Syquest 44 and 5 cartridges, that never had the
slightest problem since 1989...

3016. Re: GUI Vs Text

Newsgroup: comp.sys.atari.st

Hello Henk,

AB> Note that 'Spophisticated' doesn't necessarily mean
> better, just more complex.

HR> Thanks for the tip. Please read: "Immensely better".
> :-)

No, sophistry was never about being /better/, just more
involved.

HR> My point is that there are people for which the
> commandline is never a convenient way. People who dont
> like to be mocked for that, certainly not when they
> still know that by buying a ST, they made the right
> choice.

I hope that I have not come across as mocking in this case.
I respect the fact that people's preferences vary. It is
quite fair to say that you prefer a program with a graphical
user interface, but you made disparaging and uninformed
remarks about programmers that were unwarranted.

AB> ...in my view the Atari machines benefit greatly from
> the inclusion of GEM.

HR> I see it the other way around. Without GEM, I wouldnt
> even have noticed there was actually a brand printed
> on the case. I wouldnt even have noticed that it wasnt
> a IBM PC.

GEM started life on the PC. I would count it as one of the
important features of the 16 & 32-bit Atari machines, but
clearly not the only one.

HR> (I never touched a single key of a MS DOS computer in
> my life)

Note that not all PCs are MS-DOS computers. I'm a long-
standing critic of the PC platform. It has improved a lot
in recent years, but is still a very long way from perfect.

HR> I wonder if there has ever been a ST without GEM
> available to the public.

I doubt it.

AB> For many applications a straight textual interface is
> the most flexible and efficient way to get the job
> done.

HR> But this is not a argument for a GEM user.

You didn't limit your statement to GEM users, or even GEM programmers. It was a blanket criticism of non-GUI programming.

HR> It sounds too much like flexible and efficient to the
> programmer.

There are applications where a textual interface is more efficient, for the user and the programmer. I am not claiming that a graphical user interface is a bad thing, but it is not a panacea and *cannot* be compulsory.

HR> GEM is available permanently on ATARI, you only have
> to write for it.

Although in this newsgroup the Atari environment may be implicit, you didn't state that in your attack on non-GUI programmers. You also happen to be wrong, GEM is not available to Auto folder programs. In any case, I think this thread came from a discussion of tar and gzip, both of which are ported from a platform where a graphical user interface is not a fair assumption.

- Andy Ball.

Personal Finance Manager will cope with practically every resolution - it's
running here on a CT2 Falcon with MagiC 6.01 and NVDI 5.03 at something like
865*756.

As for Quicken files, I;m afraid not.

I didn't say that. We've heard both sides, I think more than once.

> We disagree methinks.

I can see that, but since neither will admit to being a LIAR as you
put it, it seems pointless to continue badgering one another.

I purchased a ram board from aixit, which today still works
wonderfully, I could not be happier. Yet a particular
user here openly complained about poor service and what not.
It seems to me from time to time you will just have that,
and there is nothing one can really do about it.
To this day he is probably still pissed off with aixit, whilst
I am happy.

As you said, it's life...

Again tell me what I must do to get it working? I've tried it with
MiNT/N_AES/Jinnee/scripter. No go. The same applies for
MagiCMac/Jinnee/Scripter. zip, lzh works fine but not tar, gzip.

>Not all programs that behave weird are MagiC programs, Papyrus for example
>running under MiNT/N.AES displays the icon-bar in black&white, while it
>should be coloured, I've never known you having a go at Uli Ramps...

Why should I. I'm happy with these icons. Furthermore is this a N_AES
fault or a Papyrus fault?
Don't you have problems with Papyrus under MagiC? Tell me can you see
the user defined colors? I guess you can't. Yes I know this is not
exactly a OS problem but more a problem with certain graphic card
drivers. I'm saying this only to point you out that Papyrus isn't
bugfree.

>I disagree, and I've a feeling I'm not the only one...

Not so long ago I heard another bell ringing from you.
Tell do you still using TOS nowadays? I thought you're a MagiC-user.
How many plain TOS users are there left today? Not soo many I guess.
Using plain TOS is in my eyes the same as using command interpreters in
your eyes.

Mind you these files were all for a full MiNT-net setup. Setting up
N_AES is dead easy. Setting up MiNT-net is another pair of socks.

>All I care about is that the applications I use run stable, I don't really

Even with MagiC one have to fiddling around with conf files. The
weirdest thing about MagiC is that one have to remap the keyboard. With
keytbls is rather easy but nevertheless one have to add stuff and so in
order to get MagiC running properly.

So where/how can I learn these things? Mint was fairly easy to
install, but I've never had NAES to try it with. XaAES slowed my STe
down, but I suppose I could try it on my Falcon now.

Exactly, which is why me (and a suspect a few others) have never got
it running smoothly. If you're new to Mint, you have to use NAES, and
the last thing you want to do is to spend hours pouring over the config
files to get it working. Magic is just so much easier, which is why
many have stuck with it.

I'd like to change but I just need to buy NAES, is Woller good at
shipping abroad?

I know exactly what you're saying here Lonny. The thing is that guy can only go on the experience he had - and maybe had to deal with there customer complaints dept procedure. From what I've seen the thing that really sets apart really good companies from bad is that when a problem *does* happen - and it can always do with electrical stuff especially - is that they give some proper advice/help to sort it out or service/replacement if required. I would say 99.9% of customers would be more than happy with that.

Best Wishes
Sean

>> common occurrence for others? I've never heard of this problems with
>> other computers built in the mid to late 80's.
>

The problem with the 520 and 1040 STs is that the motherboard is
mounted inside the same case as the keyboard.

The long, narrow PC board tends to flex as you pound on the keyboard,
eventually causing the chips to "creep" up out of the sockets.

The very early 520STs exhibited this quite a bit, so eventually Atari
put metal clips on the square socketed chips, but the ROM chips still
tended to creep because of the flexing.

Systems like the Mega and MegaSTe don't have this problem because the
keyboards are separate from the CPU unit.

This creeping chips problem lead to several "popular fixes",
predominant among which was the "Atari drop fix", where you'd lift the
ST about 12" above the work surface and let it drop. If that didn't
fix it, you'd hold it higher and higher, until either the chips made
better contact or you smashed the thing and it became moot.

My favorite fix, short of actually disassembling the computer to press
the chips down is to hold the computer in both hands, one hand at each
end of the case, then "twist" the case almost like wringing out a wet
sponge (gently though!).

Actually, after I installed a 4 Meg upgrade, I ended up just leaving
the screws out of the case, and ditching the metal RF shield so I
could just pop the top off and push everything back into its socket at
a moment's notice.

Interesting to note that people would put up with an annoyance like
that because they liked the computer so much..!

Ok, I have been following this very odd thread and this is the opinion
I get:

I have never seen this kind of behaviour from any kind of
dealer/company towards its former customers. Of course the opinions on
what really has happened here differ between you and the former customers,
but I must say you are totally miscrediting yourself here. Saying that,
I refer to insults in reply to people that (on your request) did step
forward to specify complaints. Shouting "liar" to former clients is
not really a good advertisement, is it? Calling them names, is not
really good publicity, is it? I seriously doubt that the so called
"LIARS" (with capital letters, which seems to be prefered here) have
made up each and every detail just out of plain evil to destroy your
business. That sounds a bit paranoid if you ask me, so I think you'd
be better off dealing with matters like this in a civilized way.

It is often said that "the customer is always right", and even if that
saying is not always 100% true it still has a lot to say here I think.
Anyone running a business does have a big responsibility against its
customers to do a good job. Obviously you have some unhappy customers
(reason for that is something I will stay out of) and probably _something_
has happened along the way that made them feel that the service was not
carried out right. Of course you might have a totally different opinion
about that matter, but throwing dirt back in their faces in reply to
complaints is really the most un-appropriate thing I have seen a company
do ever towards former clients.

I am not suggesting you should let anyone "crawl all over you" but you
could easily have stood up for yourself without the insults. It would
still be interesting to see you comment every detail in the (very) detailed
complaint that Sean Barbieri posted just days ago. Then you could
explain what happened instead of misbehaving in public, because I
don't think you will gain anything from keeping on with that.

Well, that sums up my thoughts about all this.

/Joakim

Probably what you need to do is modify the configure.in file,
install autoconf on your machine if it is not yet installed,
and re-create the configure script. Commenting out all lines
containing 'svga' could probably do the trick. Note, however,
that the comment in configure.in is 'dnl'. (Je sais, ï¿½a ne
s'invente pas !!!).

> Most BBS' are single-user -- they were a computer with a phone
>line and a modem. I think all Atari ST BBS' were single user, though
>several IBM ones were multi user.

Yeah, but so many of those multi-user BBSs were weak. They didn't have the community spirit that a lot of the single-user ones had... which is a bit strange considering that if a single-user BBS does well and then goes to multi-user, you'd expect that community to transfer. And yet it didn't.

I suppose a lot of it had to do with the nature of those BBS progs. A lot of them were just plain lousy for users to navigate through.

>Techtv.com says Atari (they don't even pick a particular model, they
>simply complain about everything from the Atari 400 to the ST)
>is 7th crappiest computer in history.

Well, FWIW, it's TechTV's site visitors that named these computers "crappiest." And I wouldn't expect many of them to even remember Atari. Indeed, I well expect most will hear of an Atari for the first time, compare 32k to 512 megs of RAM, and think that's "crappy." Of course, they don't understand how much RAM that actually was. How can we expect them to understand that it can be enough!

>By the way. The C64, Apple //, TI-99, and TRS-80 also made the list.
>Apparently computing was supposed to jump straight from the abacus to
>1 GhZ Windows 2000 machines overnight.

Also FWIW, the number one "crappiest" is the "Compaq Presario," which is a HUGE swath of a desktops, laptops, and low-end office PCs and they _all_ run either Win 98, ME, or 2k. I think that's the funniest part of the whole poll.

It seems to me that this says more about the ignorance of TechTV's audience than the "crap" quality of the particular computers noted.

>typical Spectrum game. There was a /great/ trailblazer clone, which on
>the 128 used shaded graphics and wouldn't have looked out of place
>running on an Amiga).

I haven't really given the Enterprise emulators a proper chance yet.
I'll have to drag it out and take a good look at it. I did like
Trailblazer, so wouldn't mind taking a look at this clone, and
Nodes/Arc of Yesod were pretty cool Speccy games.

As I said I hadn't really given the Enterprise emulators a chance yet,
so I'm going to have to drag it out and play around with it. Get a
sort of second-hand experience of what the Enterprise was all about.
If it played as well as it looked, I can't imagine why it didn't take
off.

>There are tons of pics, fonts, docs, tutorials and other nice goodies out
>there, one doesn't need to have MiNT or Linux installed to use these files.

O.K. My mistake. I didn't thought of that. I only saw the problem from
an applications' perspective.

>I accept that some applications are OS dependant by nature (MiNTnet
>and IConnect clients) but a shell for a packer needing a multitasking
>environment? that's ridiculous.

In that case, the solution I give in another post (using Two-In-One)
should work for everybody. It's not perfect, since T-I-O is a bit
outdated, but it should do the trick in most cases.

>Don't get me wrong: I'm not saying that MiNT isn't stable, it's N.AES 2.0
>that is causing the problems...

To be honest, I haven't made use of the installation program, since I
already had MultiTOS running. I just add the new files I needed. I did
use the install program on my MegaST, but since N_AES doesn't run on TOS
1.02, I just supposed the installation was correct but could not test
it. It seems that I was wrong.

>>The thing everyone seems (or likes) to forget about MiNT is that you can
>>do almost anything you want with it -- configuration-wise, I mean: mono-
>>user/singletasking, mono-user/multitasking, multi-user/multitasking.

>Gee... I'm really impressed :-/

I wasn't trying to impress anybody; all I was trying to do was
explaining that most of the people who talk about MiNT are referring to
a Unix-like setup. As I'm not a Unix freak myself, I'm inclined to
specify that a Unix-like setup is not a prerequisite for using MiNT.
I've been using MiNT for about two years but I installed a Minix
partition just a few months ago, and MiNT-Net a few weeks ago (which,
incidentally, is a pain in the a.. to configure. I hope MagiC-Net will

be simpler).

>What you seem (or like) to forget is that there isn't such a thing as the
>ideal OS. MiNT for example needs a relatively fast processor and lots of
>memory, someone working with a ST/STE 4MB computer will have a different
>view.

Frankly, someone with an ST/STe will have a different view about a lot
of sofware. And where did I wrote that I think there is an ideal OS? I
certainly don't think MiNT is the ideal OS. And I've got /absolutely/
nothing against MagiC. Why would I? If it didn't existed, there would
probably be even fewer Atari users around. Not a pleasant thought if you
ask me. And if N_AES didn't existed, I'd happily use MagiC by now.

>Furthermore while you may enjoy fiddling with config files trying to fine-
>tune the OS as much as possible, others are content if their apps run stable
>without having to worry about the OS. IMO an OS should be invisible to the
>user, just run and do whatever it is supposed to do, once that the user has
>to start worrying about the OS, then something is seriously screwed up.

I agree with that last sentence, Dennis, but hell, you seem to infer a
lot about my personality just by reading a few lines I wrote. I guess
you had in the past too many MagiC/MiNT flame wars/discussions :-) But
please try not to jump to conclusions; this is a bit annoying. I
don't like fiddling with config files. MiNT users don't automatically
like fiddling with config files. Where did you get such an idea?

J-F.
Cheers from the East of Belgium

3057. Atari ST telnet bbs.. now fast! What to put on it?

Newsgroup: comp.sys.atari.st
Date: 2001-02-28 13:52:10 UTC
From: jeffm@nbc.netcom.ca
Message-ID: <eo7n6.2971$TW.14868@tor-nn1.netcom.ca>
Source record: 49490

Just letting everyone know .. I did a lot of work on the emulator, and it now runs the BBS very fast. Its a little less stable, but I'm pretty sure you won't notice any problems... though theres still work on my side to do :)

So now that its fast, two message bases an a game or two really dont' cut it. I'm working on a vt102<->vt52 translator (and others as well), so that everyone can play ddst again (one fo the best online games ever!).

But any suggestions for bbs content? I'd like it to be a good gaming bbs, since we've replaced message bases with usenet and email and webboards.. but I'd like to keep the bases alive, and anything you can think of..

jeff

telnet to "shadow.skeleton.org", login "bbs"

3058. Re: ST/STE RAM UPGRADES

STE upgrades to 4MB is simple and easy, just need four 1MB 30 pin SIMMs (preferably all the same speed and make, parity does not matter). No software required. Should be able to find them in any 286 or 386 (and some 486) PC box.

Mark.

Yep, an AMD K7 Duron on a nice Gigabyte MoBo is the bests set-up I have found, this includes simplicity, reliability and above all price/speed.

Early Cyrix stuff is shit and really slow but I have not tried their 370 chips yet, anyone know?

Sorry not really appropriate for this forum hmmmm, ohhhh... and STs are great.

Mark.

Thanks for your reply. Meanwhile I downloaded the devel SVGALibs
and I simply copy it to the STonX-0.6.7.3 directory. Then "configure"
and "make" did work. This makefile builds two version of STonX :
"stonx" and "stonvga". On my Linux box, SVGALib are not installed,
so "stonvga" doesn't work properly. But what works is the standard
"stonx", and that's all what I want. I'm wondering what is the
interest of "stonvga", that can't work with me, but that is well
built. Does "stonvga" allows better resolutions ? Am I missing
something ?

That's nice of you to have replied,

Regards,

See you,

3061. Atari and Midi help please?

Newsgroup: comp.sys.atari.st
Date: 2001-02-28 15:45:21 UTC
From: ldodman@home.com
Message-ID: <3a9d1d39.1256950@news>
Source record: 49494

I have an Atari 520 ST, single sided floppy (I think) which I upgraded many years ago to 1Mb of RAM, I have a 40 Mb hard drive and DOS emulator. I haven't used the Atari in a long time.

My son is now very heavy into music, plays quitar. What is it I need (hardware and software) for the Atari to take andvantage of it's MIDI ports? Is it possible to attach the quitars and/or keyboard to the computer and enter quitar/keyboard music tracks etc, can the computer play the quitars? Is there a speaker/amplifire system available for this system? What kind of amplifier speaker system would it require?

I understand that Cubase and Notator are the sequencers of choice, is there any freeware, shareware that comes close to this? What is really needed software wise?

I am now using a PC, what is the best way to download to a disk so the Atari can read the disk, I can't remember anymore?

Is it possible to pick up any of the stuff I need in the Toronto, Ontario Canada region?

thanks in advance.............

Just one query, why is it only 40kbyte/sec transfer rate? I thought
the NE2000's were 10megabit? Is it your ST slowing it down? It's a
pity it can't be hooked up to a Falcon. (without SCSI>ACSI convertor)

Correction. There is only one customer, Barbieri, who makes allegations he
cannot
prove and goes on making them. He is a liar.

I have answered all his allegations in previous posts, who you believe is up
to you.

> but I must say you are totally miscrediting yourself here.

I disagree and Barbieri has used far more insults than I.

>so I think you'd be better off dealing with matters like this in a
civilized way.

Believe me I tried in 1998 to no avail.

> Anyone running a business does have a big responsibility against its

Indeed, I have always had satisfactory service as you just noted.
In fact some dealers went above and beyond the call of duty.
For example, one dealer included a free item, another
dealer even did a free audio mod on my Falcon. I'm not suggesting
for a moment you deserved special treatment. On the other hand
from what I read so far, breaking even would of been nice.
A full refund or at least let you pay a reasonable restocking fee
to resolve the situation. Assuming the money could not be
refunded, why not allow the customer to have a different item
at same value? I've done this too, and as long as the dealer
comes thru with some sort of compensation I still shop there,
and consider the situation not worth mentioning.

I honestly feel a refund with a restocking fee would of been
the dealers best option here.

I took a closer look at this archive at work today, and it seems like the adapter tops at 250Kb/s. It's aFTP that tops at 40Kb/s.

> pity it can't be hooked up to a Falcon. (without SCSI>ACSI convertor)

Actually, it shouldn't be too hard to modify the adapter and driver to work with the Falcon's internal expansion port, I hope someone with a bit more spare time and knowledge than me takes a shot at this ;-)

Btw. it's possible to connect a second PCI-slot with a PCI ethernet card to the Eclipse. A driver for MiNT-Net is being worked on, I suppose STiNG will be supported too if somebody wants to write a driver.

The point is not if it is 1 or 100 customers, what I reacted upon is
the way the conversation is going on with this one customer.

I still think you should treat the word "liar" with greater care!
I would not call him a liar unless I had strong evidence
backing it up if I was running a business. That is seriously
damaging your reputation if you ask me. It is obvious that your
stories differ a lot, but I have not seen anyone presenting prof that
the other one is a liar.

>I have answered all his allegations in previous posts, who you believe is up
>to you.

I am not going to imply that I know what happened, but it sounds
pretty unlikely someone would make all that up. So my guess is that at
least something was not carried out the way Sean was expecting, else
there would be little or no reason to complain at all. I think what
has gone very wrong is how the conversation about the complaint has
evolved.

>> but I must say you are totally miscrediting yourself here.
>
>I disagree and Barbieri has used far more insults than I.

I am not counting the pies here, but suggest you are the one loosing
the battle if using pies to make yourself heard here.

>>so I think you'd be better off dealing with matters like this in a

> harddisk driver, which ofcourse didn't work either since the driver wasn't
> correctly installed. Because of the corrupt boot sector you couldn't get
it
> running either when the drive was returned.
Incorrect. I ' got it running ' every time by removing Barbieris'
corruption, but read on....

Having just spent an hour with two hard drives set to the same ID, using a Link 97
and drivers by ICD, Gesoft and HDDriver I believe the corruption was a termination problem.

Preamble.

Pre- Link type interfaces, most drives were fitted in proprietary cases e.g. Third Coast, FAST etc.
using a PCB type interface, DMA to DMA ports, ICD ADSCSI etc where the drives' own terminating resistors were usually used.
Daisy chaining was rare, you usually had to open the case to access the cables,
some cases had a SCSI port on the back but the internal term. resistors were still used.
Who could afford two hard drives?
With the SCSI cable Link type interfaces using cases with two Centronics ports
daisy chaining was easier but.... it was still common to use the drives' own term. resistors,
not an external pack.

Now. Its' 99% certain in 1998 I would have supplied Barbieris' drive with the
internal term. resistors in place. Perhaps he can advise either way AND advise whether
Sys Sols' drive was terminated internally or externally AND whether they gave any advise
about how to daisychain the drives. Initially, accepting my drive was set to zero, this would
have been obvious from the info on the screen. Assuming Sys Sols' drive had the ID switch
connected, and set to ID 1, there should have been no ID conflict if Barbieri was watching
what he was doing. Place Sys Sols' drive, ID no 1, on the Link 97 and daisy chain my
terminated drive, ID zero, on the end. This set up works, I did it an hour ago.
Agreed, he couldn't use Sys Sols' drive as the boot drive but the system would still work.

The problem seems to be whether Sys Sols' drive also had its' term. resistors connected.
I have seen their drives internally terminated and with the ID switch incorrectly, or not, connected.
It's worth repeating that my drive worked perfectly every time I sent it back, with or without
the ID switch connected.

> If the drive is the only one in the chain then the ID conflict would not be
> noticed,

If it was the only drive there wouldn't be a conflict.......

> I take it that you tested the drive like that and weren't aware
> that the ID connector didn't work... when the "repaired" drive was
returned
> to the customer, he was faced with exactly the same problem as before...

No. He managed to screw it even with the ID switch connected. See above.

> ..... the fault was caused by the ID selector that wasn't connected it's

Taking the termination issue into consideration you may want to
reconsider....
In the heat of supporting Barbieri did it ever occur to you? He never
mentioned it in 1998
or in his posts. OK, neither did I. Did Sys Sol?

> >When I despatch a hard drive it is set up as the customer has ordered.
> I can't imagine anyone ordering an assembled harddisk with non attached ID
> connector to the jumpers, leaving only one available ID number...

Have you met Bar.... No excuses but it was not uncommon.

I'd choose the latter two.

Actually, I think the signs that were put up may be ambiguous or not strong enough. This was before any cases were confirmed in Wales and they were not taken seriously. The wording is something like "walkers are asked not to cross grazing or farm land to prevent the spread of F&M". Well, when you're intending to walk up Snowdon, I can see that people are going to think "OK, we won't go into any farmyards then".

They should have explained how F&M is transmitted and that *any* contact with the countryside can do it! Also, it should have said "we request you not to pass this notice" instead of "walkers are requested not to cross grazing or farm land".

Most of Anglesey is closed down today!

stonvga gives you more the feeling to really sit in front of an ST,
because there is nothing other on your desktop. Apart from that it
just maps Atari memory into the Linux Framebuffer (which can also be
done on X11 with the shared memory extension of X11). Some people try
to build an X11 based VDI, which works natively. This then would be
much faster, than an emulated one.
Me myself do more like the native work - fVDI e.g., which also works
on X11 as on SVGAlib. In the end it does not matter. X11 may be better
for developers. You can have the emulator on the left, end you IDE on
the right.

Martin

Yes, you can use the X11 Interface, which works just fine. For running
an SVGAlib program you need to be root.

For X11 just write

make stonx

Think you might be on the letter point :-)

I've used PFM+ (Personal Finance Manager) for many years and have had no problems, it works in both resolutions and is definitely Y2K inspite of the fact it came out in about 1991 and can handle up to 10 accounts all of which are interlinked. It works very happily in MagiC.

If you want more info. let me know.

Following on from my recent threads regarding A4 Scanners, I have another query regarding the Freeware GT Look2 software. I read in article in Atari World (RIP) that the original package sold by Digital Arts had two add-on modules which at the time cost 50UKP each. The two were: Optimiser and Photocopier, quite simply are these two included in the Freeware version now available from Derryck Croker's Site?

The article in the Mag (Aug 1995) also lists the compatible Epson GT scanners available at the time, eg 6500, 8500 and 9000 - these were listed as having Parallel and/or SCSI ports. I have found some newer scanners for sale (with SCSI and/or Parallel) and wondered which are the better models to go for ie that stand a chance of working with GTLook (in the absence of any other suitable software?

The scanners I have seen are: GT7000, 9500 and the new Perfection 1200 SCSI? I am not sure how many light sources each of these has.

As ever any more information would be gratefully received!

Neil :-)

Incorrect again - you had to "replace" the actual drive *twice*
because it would not spin at all on power up.

> Now. Its' 99% certain in 1998 I would have supplied Barbieris'
drive with
> the
> internal term. resistors in place. Perhaps he can advise

The drive - which died the last time I received it, before binning it,
I checked the drive and the internal termination jumper was _not_ set.
The drive was sent with an external termination pack. This is all
achedemic because I always tested your drive on it's own - only when
it wouldn't work reliably did I then decide to not use it as a boot
drive to see if that helped - where I then found (via software) that I
couldn't change the ID number. The System Solutions drive was only
externally terminated and ID switches worked ok.

> Agreed, he couldn't use Sys Sols' drive as the boot drive but the
system
> would still work.

Problem was that it still didn't work reliably on it's own or linked
to the other drive. If it had I wouldn't have had to resort to buying
another drive to try to get some work completed.

> > >When I despatch a hard drive it is set up as the customer has
ordered.

Are you now saying that I did???? At that time I hadn't ever seen an
Atari hard drive so would never ordered this "feature".

are there complaints when the helpful Dr. Seimet posts about his first class product, or offers advise on it's use? I think not

funny how ideas change, not long ago when complaints were posted here about a certain "Billionaire smirk" Atari shareware scheme organiser placing blatant ads for his latest "Empire of the month" in his sig file, this had nothing to do with Ataris yet dozens of folk jumped to his defence.

Before this I didn't know that Keychange even existed, I am glad I now do also that they repair Ataris and sell some very important software at a good price, more power to their elbows I say

3082. Falcon

I have inherited a Falcon in a Tower case and a Falcon as it came... and its still boxed too but no system discs... and a batch of STEs and SM124 Monitors.

Will someone please tell me how do you get to use and IDE 3.5" HDs capacity on a Falcon? I have the 85m one which was originally in the Tower Case... its a Quantum and I think its' goosed. I'm going to try it on a connector for a PC I use for repairing laptop HDs and see. In the meantime, I thought it might be good idea to replace the drive in the Tower and install a drive in the boxed Falcon... both 4M as yet. I've brought ST drives up b4 ON STs, using that poor AHDI thing Atari did. I think I've got the latest version now but it doesn't go beyond a 60m HD and the smallest I have to hand is a 340M, the other is a 1.2G.
I really don't want to format a 340 as a 60, or for that matter a 1.2G. I get the feeling from articles I've seen that this is something that can be overcome... perhaps without resort to too much expense or departure from the Atari system.

I'd appreciate pointing to where you get the 14M boards for the Falcon too, if anyone knows.

Hi Neil,

When I had a look at the coding for GTLook 2 whilst translating it
into rough english, I noticed embedded RSC coding for DAPrint, but
not Optimiser or Photocopier. I think that the gTLook that has been
made PD was the first try by DA and that they intended to develop it
later to enable the within program printing, but never got round to
it. Could be entirely wrong, but at least I think the answer to your
question is NO.

I found "Intelligent Reassembler" for DOS and Unix; its not ST
specific, so I had to extract the code segment from the PRG file to disasm
it. The code is pretty nasty, so I'm not sure if this disassembler doesn't
do a good job..

I'm disassembling some stuff originally written in Personal
Pascal; man, its some seriously ugly 68k.. and I'm already pretty rusty :)

This *was* agreed and after I sent everything back he changed his mind! saying he didn't now mean it and only said it because he had been annoyed that I had been using a different supplier(!) (System Solutions) while I was trying find out why their drive always worked no probs and his didn't. I have never come across this before from a so called "dealer".

> I honestly feel a refund with a restocking fee would of been
> the dealers best option here.

I agree totally ;-) but as he doesn't admit to _anything_ at all now and I am called a Liar (Something I've never experienced before) there is nil chance now, as there was at the time, of this occurring.

Best Wishes
Sean

Now, THAT's a nice statement! Especially considering thart one needs
tar+gzip primarily to unpack files :)

> It's about time programmers lets go TOS. TOS is dead. I haven't use plain
> TOS since 1995.

I disagree strongly. Not because TOS is very good, but because Mint/NAes
stuff can develop its virtues only on machines like Milan, Hades and
perhaps TT. On everything less it is so slow and memory-cramped as to
be unusable. So the above statement is equivalent to: everything below
a TT should be thrown away...

There are worse things... at work, we have a custom-built piece of professional equipment which, when it came several years ago, started misbehaving after several months. Upon opening it, we found out that the pins of all TTL chips (nicely and professionaly socketed) were completely black from oxydation. It appears that the alloy used for pins was faulty on that batch (and the chips were made by TI, notning less !). There was no hope of maing the device work until we replaced those TTLs.

Indeed, that was a very "bright" move of the Yugoslavian government,
thinking that if they wished hard enough for domestic computer industry,
it would materialize. That move in fact retarded computer-literacy in
Yugoslavia for several years.

>As an insult to the injury, all those machines bared names
>of partisan heros (WW II stuff).

Let's not exaggerate. AFAIK there was only one computer named after the
company which produced it and which was named after a war hero ("Lola").

Other names were "Galaxy" (named after a magazine which promoted it),
"Orao" (the eagle), "Pecom" (personal computer- a weird nonsense
using a processor noone has ever heard of- some chip name like CDP1801
or similar) , "Slovenia" (a nice make-it-yourself CP/M machine named after
the former federal republic, etc.)

Andy Ball wrote:

> Spectrum. I understand that was the basis for the
> Intercompex (sp?) Hobbit machine that was made in St.

That was in former USSR, but Yugoslavia was much more west-oriented and
open, so Intercompex was just mentioned in a magazine.

>> I remember scraping the money from all my relatives

> Was it based on a Z80 microprocessor? I would be interested
> in knowing whether it was a Western part, or a clone.

Yes it was with Western (or Japanese) parts, decent chips could be bought in
Yugoslavia of that time, - in fact more than now! And yes, Z80 was used.
The whole project was very educational. It was completely built with
standard, easily obtainable chips. So, you could really see how, for example,

a DRAM-controller worked, refresh and all- it was made from simple TTLs.
The project started with a small static RAM, but then a DRAM expansion card
was added (to 48KB, I think), as well as sound, monochrome graphics, etc.

I have heard of several instances when people have used the "Galaxy"
as embedded intelligent controllers in some special equipment. I think
it was more advanced than the ZX-81.

>> Other from many serious contenders was "Wolf", which
>> was in QL class, only simpler, with intergrated Pascal
>> compiler instead of SuperBasic...

> Did it use a 68008 microprocessor?

AFAIK it was with MC68000 or 68010

>> One of them (and IMHO ONLY) was our "Iskra", which had
>> developed multi CPU modular VME machine (68000/68010,
>> 80286 and later 386...

Was not this the "Triglav" (the three-headed) machine? Didn't it use
a Z80 (for CP/M), 80*** (for DOS) and PDP-11-whatever (for RT or RSX-11)?
Indeed it had a very original external appearance.

> I'd heard of Iskra, but had not realised that it was a
> company name. I certainly didn't know they had used 680x0
> processors!

Iskra is indeed a company name and at that time they had a remarkable share of
world's production of resistors and condensers. They were of very good
quality. Maybe you have even seen some of their components- company's
mark is a slender star with five uneaqual rays over a circle- Iskra=spark :)

> Did you ever see Atari machines (or clones?!) around this time?

This all happened a couple of years before the ST appeared. The most
esteemed home machine among the local Yugoslavian gurus of that time was
BBC-B, and there were not many of them.

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've got Hardware, Software, Books & Accessories for Classic Atari 8 Bit, Atari ST Computers plus Atari Jaguar Game Machines! Plus I'm adding more all the time. On a side note, I wanted to say Thank You to those who have supported Bravo Sierra Computers! Without my Customers, I couldn't continue supporting the Atari Users and their Atari's.

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my

E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/
Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hmmm. I did not think too highly about Slovenia. Too much stuff for too litle
effect.
You had to buy a pile of PCBs and many chips and end with what ?
There were no get-it-all place where one by everything besides soldering iron...

I have much better opinion about TIM-011, which was born in your neighborhood.
Very nice thing. Sleek Hitachi's super Z-80 on some 10 MHz, accessing 512x256
graphic
WITHOUT the wait states,capable of accessing 2Mb with 0.5 Mb on board, CP/M ready
and with everything inside pretty cool monitor casing. And off course everyhing
was explained
thoroughly in the "Racunari" magazine...

Iskra was in the bussiness of making Z-80, at least for a while. I think that's
the
part of the reason why did they bought the license from Sinclair for making
Spectrum16K
and 48K...
Later, they have discovered that they can't compete with others and IIRC
reoriented
to automotive stuff, which needs to be sturdy, but crude (several microns geometry
etc...)

>

The coolest part was that everthing went PUBLIC. So, when someone made
eg. EPROM expansion or graphic module, everything was thoroughly explained through
the
series of high quality articles. Everything in YU revolved around several computer
magazines,
all of them very good, but "Racunari" (Computers) were head and shoulders above
everything else.

>

I the process of Iskra's "privatization", where everyone was stealing what he could, everything
remaining after that was sold gradually to the best bidder. It was joy of practically all hobbyists
in Slovenia, since they could buy chips on the showel for peanuts!
No one in the remaining personal had any idea about real value for every chip, so everything was
sold on the basis of appearance. I remember buying some 100-200 68010 in ceramic package for
1 DM apiece, and that was relatively expensive ;o)

While looking around for next bargain, something brought tear into my eye.
MicroTriglav !
Or better said, unborn infant. Basically, they did with it, what I wanted to do with QL long time ago.
Picture small VME bus backplane, maybe PCB 20x 10 cm (with place for some 8 VME cards), mounted vertically. In fact, whole case was10 cm width, just enough to accomodate the floppy 3.5" and small hard disk. Under VME backplane was miniature PSU and that was it. Externally, everything looked like modern minitower, but in the scale 1:2 and with floppy at the top of the case. You should see it !

Oh, yes, one more thing. Iskra was also manyfacturing VAX machines for the domestic needs and
probably some aside for Russians. How many ? Lets say that I have seen some 100 m3 of the VAX
manuals being dumped at the cleaning of the building.

They even left one machine in the building and it was impressive. I remember many times walking
past it thinking it was central heating furnace for the whole building ;o)

Regards,

Branko

I have the same problem with HD Driver 7, my harddisk boots but it only finds that device and so I have to put the PRG into the AUTO folder to find the rest of the devices.

I have sent the money to upgrade to V8 so I do not want to play around getting 7 working just to upgrade in a week or so when it comes (SS have not cased the check yet so I imagine they are waiting for HDDriver, Magic or NVDI to turn up).

Will V8 install over the top no problems?
Is it possible to boot from a Syquest drive?

Mark.

Sounds more like it :) So why can aFTP only do 40kb/s? I suppose it
doesn't expect it to be run across a fast network.

Hmm, you've got me thinking. I think it'll be quite difficult though.
I don't have a clue how to write a STiNG driver so it would be useless
for me to even try, but I'll look at the schematics again.

>Btw. it's possible to connect a second PCI-slot with a PCI ethernet card

>The scanners I have seen are: GT7000, 9500 and the new Perfection 1200
>SCSI? I am not sure how many light sources each of these has.

I have a 9500 and it works a treat with GTLook 2, just trying to get
Epson GDPS driver set up to use the auto feeder but this software
hates my Falcon (like many other Falcons). I have a strong feeling
it'll work with any GT scanner. I'd stay away from the perfection
though as I doubt it'll work, but if it's possible to try, go ahead.

SCSI is well recommened, but on a Falcon (that follows the full parallel port
standards) it could be possible to use a GT scanner with the parallel
port.

BTW, I've never heard of those other prog's but it would certainly be
nice if they could be converted to English.

>tar+gzip primarily to unpack files :)

I know, I know. I only said that because some one else stated that Guitar
wouldn't work at all under MagiC. IMHO the problems with Guitar is
caused by a bug in the mintlib used by the author but as I'm not a
programmer I'm really do a wild guess.
When you drag/drop a tgz archive onto Guitar the contence is listed but
after each entry there is a [cr] sign.

The same thing happens with the latest Amail version and this not only
under MagiC but also under MiNT too.
The charset encoding tables are listed with a [cr] behind the name in
the setup/misc charset option. If one change the line end of these
tables files from Atari to Unix style the problem goes away.

>I disagree strongly. Not because TOS is very good, but because Mint/NAes
>stuff can develop its virtues only on machines like Milan, Hades and
>perhaps TT. On everything less it is so slow and memory-cramped as to
>be unusable. So the above statement is equivalent to: everything below
>a TT should be thrown away...

For the modern stuff yes. Making soft compatible to almost every TOS
version available is a waist of time and effort. Furthermore some Atari
stuff is already to heavy to be used fluently on machine less then TT030.
Take for instance Calamus SL2000. On a TT030 Calamus is just usable. The
same goes for Papyrus. On the Hades it runs pretty fast but on my TT030
it's rather slow. I never have used large Papyrus docs on the TT030 but
I'm been told that loading very large pages is a nightmare.

This sounds familiar, this has happened to me frequently when i'm trying to backup, i mentioned this to Uwe Siemet as i used his software, he never heard that problem before, it doesnt happen now with the version i currently use, but when it did occur i could re-partition and re-use the carts.

I thought I'd just share a few thoughts. I can't seem to stay away from the Atari platform even if I try. I've had a few Falcons, TTs and STEs and I've kept on selling them and buying PCs and selling the PCs and buying Ataris. The reason for that has been that I find the Atari's too slow even though I had a souped up TT with gfx card at one point. I'm also frustrated by the fact that browsing the internet is slow and I can't access many sites. So I then sell the Atari and buy a PC not being able to afford to keep them both at the same time. After using the PC, my last one being a 700Mhz CeleronII, I start to regret selling the Atari I sell the PC and buy another Atari. I just bought a C-Lab Falcon MKII from Germany for a good price after selling the CeleronII system. So I'm waiting anxiously for the Tempest or CT060 to keep up to speed. Oh, and if you guys have an accelerator, 14Mb memory or gfx card for the Falcon you wanna get rid off, let me know. There definately is something about the Atari computers that is worth keeping. Long live Atari and down with the others!

Don't worry about your 14Mb. I used MiNT+N.AES on a 18/20MHz 030-Falcon with 14Mb for three years, and a year or so with a 16MB Afterburner, and this was plenty.

Currently I need a *lot* more RAM, but this is the side-effect from buying a 4Mb graphics-card ;-) Background-buffers takes a *lot* of space when using 1280x1024x16bit, and it's a lot more fun to use DTP- and paint-programs...

Unfortunatly, unless you own an After Burner or something, PGA is useless to Ataris, well, for STe and Falcon anyway, not sure about what the TT has.

Ah, OK. As long as I have about 8Mb free I'm OK, as scanning puts a
stress on my limited memory. I would of hated to do this on my STe!

Magic, NVDI and Jinnee with 1024*704*16 colours takes about 3-4Mb of
RAM, so I can imagine that running that at 16 bit would be quite a bit
more. I can't go no higher as CPU power has to be comprimised for.

3125. Atari 1040ST on standard RGB monitor?

Newsgroup: comp.sys.atari.st
Date: 2001-03-02 00:09:17 UTC
From: Piozet <piozet@ihot.com>
Message-ID: <3a9ee44b@news.ihot.com>
Source record: 49310

Hi,

I have an old NEC RGB monitor with TTL/Analog RGB inputs. Is it possible to build a cable that will run an Atari 1040ST on standard RGB, or will there be things preventing it, such as the "clock select"?

Thanks in advance!

-Steven

> > system, just in case the PC MIDI implementation gets interesting ;)

>
> If your a serious Midi user, should be using a TPB/G4!

BZZT! WRONG!

To begin with, you'd have to buy a MIDI adaptor.

secondly, more money to buy a microphone adaptor (TP4/G4 Powerbook
don't have a microphone jack for hard disk recording input - in fact,
none of the current G4 towers have no microphone input, requiring
adaptors or expensive microphone input cards).

Thirdly, who wants to buy a machine whose main proponent is a loser
geek with no life who claims to be an "Apple Power Rep", but who doesn't
even know how to spell "you're", much less realize that MIDI is spelled
in all capitals?

Fourthly, nobody cares about TiFKAS' opinion, he having proven over
the course of eight years that he's easily outwitted by a jar of
vegemite. Indeed, even Mac users admit that TiFKAS' foaming at the mouth
"advocacy" is considered counter-productive to converting users to the
cause.

> sinclap!
> somewere in mn

totally embarrassed at how President Duh won the election rather than
Al Bore, who TiFKAS swore up and down would win by a landslide. Not to
mention how his governor Jesse "The Baby" Ventura whored himself out to
the biggest sports flop in US history, the XFL....

Should be OK, the ST's only use rgb, gnd, h and v sync. Must be analogue
tho. Have a look on the quickst faq for pinouts.

> >>do almost anything you want with it -- configuration-wise, I mean: mono-
> >>user/singletasking, mono-user/multitasking, multi-user/multitasking.

This is true, but ONLY if you are prepared to dig VERY deeply into config files, and other inane crap MOST people cannot be bothered with! Trust me I'm trying to install a MiNT 1.15.5 single user setup, for internet and for GEM/TOS based software. I'm NOT interested in editing config files yet I have had to dig a hole as deep as the Pacific to just get the AES 4.1 desktop to appear. STiNG is not co-operating with MiNT (or vice versa) so the internet account I'm PAYING for is sofar useless...

> partition just a few months ago, and MiNT-Net a few weeks ago (which,
> incidentally, is a pain in the a.. to configure

Yes, MiNTnet is a right pig to configure. Why the hell cannot these unix freaks (sorry, but you ARE) create a nice GEM frontend to auto-configure the software, so we of average intelligence do NOT need to pull hair out to use it? It really pisses me off!!

> >IMO an OS should be invisible to the

> please try not to jump to conclusions; this is a bit annoying. I
> don't like fiddling with config files. MiNT users don't automatically
> like fiddling with config files. Where did you get such an idea?

Um, well maybe the total lack of decent GUI based, easy-to-use setup software for MiNT explains that MiNT users are happy bashing out the configs all night in text-editors...I just cannot see it any other way.

kellis perhaps could take note of this as I think the very cool MiNT-setter begins to approach the thing I look for. Something that removes the 'config file' mentality from installing MiNT and things like MiNTnet would be superb. Oh, and another gripe! Why the f**k do things intended for use under MiNT always have to be placed in a TARed GZIP (.tgz) or similar file? We of average intelligence again do NOT like the long

winded process of unpacking these, when a simple ZIP or LZH archive would suffice. Don't quote me on 'file permissions' or other crap too, as I am NOT interested in such technical matter...only in if it will continue to offer GEM functionality and form...

Kind regards,
Chris Wilkinson, Christchurch, New Zealand.

Have you tried one of the various "Snap shot" programs there are around?,
some are PD and some are provided with other programs like WP's or DTP
programs).
They are usually accessories and so you can only use them if the screen you
are trying to caputre makes use of (or grants access to) the GEM menu bar.
I'm not sure what image format the snapshot is saved as, IIRC the one that
came with my copy of 1st Word Plus saves it as a GEM image file.

3135. IBM PPC750cxe @ 700 MHz

Newsgroup: comp.sys.atari.st
Date: 2001-03-02 13:33:39 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <TiNn6.5272$A12.8673295@nnrp6.proxad.net>
Source record: 49320

That's the CPU that was choosen for the RIORED-J design.

http://www.theregister.co.uk/content/39/17253.html

IBM has begun sampling a revised PowerPC 750CX, the G3-class processor that ships in two of the latest generation of iMac
- or in only one of 'em if you live outside the US (see Apple fobs off non-US iMac buyers with lesser CPU).
The 750CXe primarily adds support for bus speeds of 133MHz. However, it does pave the way for the 700MHz version of the chip, due next May.
It also uses copper wiring to reduce the part's power consumption. According to Big Blue, the 400Mz 750CXe draws 3.5W, down from the 400MHz 750CX's 4W.
By then, the 400, 500 and 600MHz parts will be shipping in volume. IBM said it expects to ramp up production in April.
Fabbed at 0.18 micron, the 750CXe incorporates 256KB of on-die L2 cache, which not only improves performance - data and program instructions in the cache can be retrieved at the same speed at which the chip's core runs - but saves Apple the cost of ading an external L2 cache module. A small saving, but not to be dismissed.

The 750CXe is priced at $57, $93.75 and $143.75, for the 400, 500 and 600MHz parts, respectively. That's in batches of 10,000.

I'm a long time user of Magic 6.1 and I've installed it on several computers. The problem I'm having is trying to get the English resource files to work. Everything else works except for magxdesk.rsc. When magic loads up it gives two bombs and brings up a fileselector to find magxdesk.app. It won't go through. This happened on my TT030 and now on my MKII Falcon. Pretty annoying. Anyone have any ideas or experience on the matter? Thanks.

Joshua.

I would like to have MINT on a SyQuest disk and Magic on my hardrive, but I can't. I think this may be a problem with me not being able to read German though as it came with a German TT and is in German.

As mentioned when the HD boots it only sees that drive, to boot from another drive I would then have the press the relevant drive letter key, right? But for that to work I imagine it would need to see the others drives at boot?

Any quick thoughts? as mentioned I do not want to spend much time on this as I will be doing it again soon.

From: Micka&#65533;l Pointier <mpointie@eden-studios.fr>
Message-ID: <97ok2t$qe8$1@reader1.imaginet.fr>
Source record: 49325

Hi.

I would like to know if any kind of 68881 or 68882 co processor
can be plugged on a MegaSTE motherboard ?

Someone proposes me some of those chips, but I do not know
if they are in the right "pin packaging" and if they are at the
correct frequency.

The chips looks like ST's MMU and GLUE chips but they have
pins on the bottom side instead of on the borders. It looks like
it needs something like old ZIF's sockets for pentiums processors.

For the frequency, they range from 16 mhz to 25 mhz.

Should I risk something if I plug one of these chips ?
Some incompatibilities ? Things to setup ?

Thanks in advance.

Mickael Pointier

STing is very co-operative with MiNT (all versions) but not with AES
4.1.
I believe this is mentioned somewhere in the STing docs.
If you really want to use STing with MiNT get N_AES. Sting, (STik,
Wensuite, Draconis and even Iconnect) works very well with N_AES.

There was a very good configuration CD, called MiNT'98 available but
unfortunately the authors has suspended the devopement. With this CD it
was very easy to set up a MiNT-net environment.

>Um, well maybe the total lack of decent GUI based, easy-to-use setup

Once one is familar with MiNT one doesn't need to spend whole nights to
edit configurations files.
>
>would be superb. Oh, and another gripe! Why the f**k do things intended

Because it's much better then Zip and lzh.

>We of average intelligence again do NOT like the long

I also belongs to group with an average intelligence and yet I'm able to
use TAR and GZIP.
If you've a working MiNT setup use GuiTar. It's as easy as STzip or

LZHshell.
For MiNT/MiNT-net users file permissions, etc. is very important and
indeed ZIP nor LZH offers this.
Again I really don't understand why using TAR/GZIP is so difficult.

gzip -d what_ever.tgz extract it to what_ever.tar
tar -x what_ever.tar extract it to what_ever

tar -xzvf what_ever.tgz pass the archive first trough GZIP.

This methode requires however a good working MiNT-net setup

Hi, Laurent!

To leave STonVGA you just have to press <F12>. Then you should get
back your commandline.

SVGAlib always needs to be configured in

/etc/vga/<don't know exactly>

There you have to set your mouse. Mine is PS2. Also - if your card is
not directly supported - please set "VESA mode" hard.

The current Calamus version works only with 256 or true color. You can't
use Calamus SL2000 with 15/16 bit. Sad but true.

Its not that simple, you also need a GAL chip tats absent from the mother
board in order to use an FPU. Ive got one in my MegaSTE, i dont wake it
up often. You should sit down and think about why you'd need one.

Hi Joshua

>I'm a long time user of Magic 6.1 and I've installed it on several
>computers. The problem I'm having is trying to get the English resource
>files to work. Everything else works except for magxdesk.rsc.

I take it that Magxdesk is OK with the origonal german resource?. If so
i'd obtain a replacement resource archive, i suspect yours is corrupted.

I obtained my Magxdesk resource from DDP, purveyors of finely translated
software although i translated the binary myself.

If this doesnt cure it i suggest you start looking elswhere for problems.

You could try installing the demo of Jinnee, this will eliminate some
possible problems, such as MAGX.RAM corruption, then you'l want to buy
it, as its the best desktop ever produced for the Atari system.

For the RSC, URL in most gents toilets, or here.

http://www.cix.co.uk/~derryck/index.htm

Click on the "DDP" button at the top right, scroll down midway and its
called "MagxDesk 4.0"

Source record: 49331

I didn't bother to read the article, I can guess the content
without much imagination.

These people have no idea just how crap some home computers
(and even some mainframes) can be.

How about the Acorn Atom with the dodgy keyboards that
usseedd ttoo dupplicccccateeee lettteeeerrrssss ddduueeee to
keybounce problems. Or the ZX80s that used to overheat,
ZX81s were much better but the early RAM packs used to
wobble and crash the poor things.

Tape decks were the bain of early home computers but
the early floppy drives weren't any better. They were
a bit faster but it just meant you could have more
retries at loading that program.

My favourite memory of those days was the report in the
once highly respected computer magazine of a new machine
launched with much ado at a big computer exhibition.

The reporter wrote how IBM won the (fictitous) award
for "announcing the biggest box with the least in it".
This was of course the IBM PC.

In any sane world this machine would have vanished into
obscurity faster than a Jupiter Ace but unfortunately
IBM had a pit of money and their competitors didn't.
Most of their competitors were building computers
in disused cowsheds in Cambridgeshire and were one
late payment away from bankruptcy. Anyone remember
the Camputers Lynx, Dragon 32 or the Lucas ?

Ignore the poll and have fun.

Hi Hallvard!

I installed the MagiC Mac Demo (really like it!!) and here everything is
fine with .ttp programs from the Desktop. Also with sox. ;-) In any of
the three memory settings I can choose.

As I have PowerPC, Cache is automatically disabled. Did you try to
disable Cache in the dialog that pops up when you press OPTION while
clicking on the MagiC-Icon. Jut a guess in the dark- had strange
problems with processor cache on another computer that are probably similar...

It had nothing to do with decency, the "main players" would not want
the users to post messages to them here in case it opened a can of worms.

>so the internet account I'm PAYING for is sofar useless...

STiNG worked for me with the AES 4.1. DRVIN, MFP (or SCC) and STiNG
must be run /after/ MINTNP.PRG. DRVIN and SCC must be run /before/
MINTNP.PRG when using MiNT-Net. This at least is my experience.
There's a configuration program for N.AES. It's called N.AESCar. There
will never be one for the AES 4.1, of course. As for the configuration
of GEM.CNF, well, there is not much to configure, as far as I can
remember.

>> partition just a few months ago, and MiNT-Net a few weeks ago (which,

>to use it? It really pisses me off!!

If they are Unix freaks, why would they bother programming a GEM frontend :-)
On a more serious note, MiCo, from Marc-Anton Kehr, is able to configure
at least parts of the MiNT-Net setup -- it basically does the same job
than the STiNG dialer. There is english docs and resources.

>> I don't like fiddling with config files. MiNT users don't automatically

There is one for MiNT-Net, and one for N.AES. That makes two of them.
That isn't enough, I agree, but it's a start.

>kellis perhaps could take note of this as I think the very cool MiNT-

As already stated in other posts, under MiNT you can use GuiTAR to
pack/unpack tar/gzip files. Zip and lzh are the standard under TOS,
tar/gzip are the standard under MiNT. Since there is a shell for it
(which is simpler to use than STZip) I can't see the problem. There is
no long-winded process with GuiTAR.

3156. STFM 72pin SIMM ?

Newsgroup: comp.sys.atari.st
Date: 2001-03-02 23:56:43 UTC
From: chris swinson <exxos@bigfoot.com>
Message-ID: <97pc3prct1@neptunium.btinternet.com>
Source record: 49339

HI all,

Does anyone know how (if possible) to hardwire a 72pin 4 meg SIMM into the STFM ? I managed to do it with 4 30 pin simms (used the STe design and hardwired into the STFM) though all the address and data lines are correct, there seams to be a miss with the RAS lines, there seams to be 4 RAS lines on the simm but only 2 on the ST. On the St they are paried to 2 banks, thus 2 RAS lines, but with 1 simm it might casue a problem ? anyone ??

Thanks

Chris

I have recorded a sample "radio ad" for Atari. I'm going to save it to floppy and submit it to Infogrammes in a few days. Here's to hoping they like it and decide to do something positive with my ideas/suggestions.

Naturally, I relinquished all ownership of contents, in the letter, just in case they have a "no outside submissions accepted" policy, which would probably kill the letter before they even listened to the audio file!

If anyone wants to hear the 30+ second spot I recorded, just ask. I'll Email it to you. It's about 800K in size. It sounds pretty bad (audio quality-wise), but I think it really expresses the excitement I think Atari's revival could bring to the masses...

Jared

>bill can't tame the elements...

Give it time. Microsoft Weather(tm) isn't too far behind Microsoft
World(tm) 2002. Here's a sneak peak at the latest builds:

Microsoft World(tm) 2002 Beta 1051 Whatsnew.txt:

- Fixed earth's rotation. Now adheres to IEEE 144.2 spec. Days now
32 hours long.
- Fixed sun bluescreens. No more "midnight at noon!"
- Isolated cause of polar ice caps melting, and adjusted earth's axis
to 22 degrees from 11. Oopsie! Sorry Northern Canada! Microsoft
Global Disaster Recovery Kit(tm) will clean that right up.
- Fixed Australia's Koala decimation problem. They eat _eucaliptus_
leaves! Oops. Microsoft Wildlife Genome Kit(tm) will fix that right
up.
- Still working on that whole continental drift problem. Meanwhile,
just consider how much you'll save on air fare travelling from
Greenland to Europe!
- Moon's perigee fixed. Satellite will no longer "buzz" South Africa.
- Partially implemented Aurora Borealis and Aurora Australis. Folks
in northern and southern parts will have to settle for luminous Tartan
patterns for now.
- Land masses now "skinnable"
- O-Zone holes patched with temporary plasma "toupees." Microsoft
Radiation Treatment(tm) should go gold before the exposure burns
become fatal.
- Miscellaneous bug fixes.

Microsoft Weather(tm) Alpha 0002 internal development team memo:

- Completed work on preliminary tornado development. Took out a team
of storm chasers and a cow. We're live, baby!
- Tides now respond to lunar position, but we're still experiencing
enormous tidal waves off the coasts of Ouahu and Fiji. Microsoft
Evacuation(tm) beta tested with limited success.
- Cumulous, Cumulonimbus, Stratonimbus and Cirrus clouds implemented.
We're still working out why they're coming out green.
- Weather cycles partially implemented. Evaporation works, but the
water just comes right back down. We'll proabably have to finish the
cloud routines before this works right.

- Rain works -- sort of. We're working on a way to get the routines
to differentiate water from sewage reclamation vats.
- Wind patterns implemented, but erratic and intense. The Bay area of
San Francisco has been blown clear across to San Bernadino. Oops.

As you can see, lots of Microsoft-style progress here. :-)

I'm sure you're exagerating. I'm only a glorified user, but the only
benefit of a windows environment is to be able to select from the
total range of options easily. Once I know the options available I
would hate to be grabbing for a mouse all the time. Everything would
take 10 times as long.

I seek out keyboard entry in preference to the mouse every chance I get.

If MTU is 1500 then MSS ought to be 40 less. However, MSS is no longer
necessary since STiK v1.10.

I've found some info from Peter Rottengatter and Charles Silver in a
very old message from someone named Derryck Croker <g>. Also, I've
found this old thing from Joe Connor that may be of some use.

...that people would be excited about knowing that Atari, as a product manufacturer, (not just a software brandname) is back. Trust me, as bad as it sounds (audio-wise), I gave myself a chills just listening to it.

Try to be open-minded when you hear it. Try to believe that you're actually hearing this on the radio and then tell me... did you get excited?

If Infogrammes was willing to spend multipled millions (and a few millions more than Hasbro spent) on Atari (or the whole kin-n-kaboodle, including Atari), then they must have plans for success for this purchase. All I'm trying to do is help them SEE that potential for future revenues (through Atari) from people like us willing to buy a new Atari computer system and game system, based on more pwoerful hardware than ever before (on an Atari, that is).

Source record: 49361

O.K. - so it's a bit off topic talking about Bill Gates, but I thought some of you might enjoy the following, which was e-mailed to me the other day:

At a recent computer expo (COMDEX), Bill Gates reportedly compared the computer industry with the auto industry and stated "If GM had kept up with the technology like the computer industry has, we would all be driving $25.00 cars that got 1,000 miles to the gallon."

In response to Bill's comments, General Motors issued a press release stating: "If GM had developed technology like Microsoft we would all be driving cars with the following characteristics:

1. For no reason whatsoever, your car would crash twice a day.

2. Every time they repainted the lines in the road, you would have to buy a new car.

3. Occasionally your car would die on the freeway for no reason you would have to pull over to the side of the road, close all of the windows, shut off the car, restart it, and reopen the windows before you could continue. For some reason you would simply accept this.

4. Occasionally, executing a manoeuvre such as a left turn would cause your car to shut down and refuse to restart, in which case you would have to reinstall the engine.

5. Only one person at a time could use the car unless you bought "CarNT" but then you would have to buy more seats.

6. Macintosh would make a car that was powered by the sun, was reliable, five times as fast and twice as easy to drive but would only run on five percent of the roads.

7. The oil, water temperature, and alternator warning lights would all be replaced by a single "General Protection Fault" warning light.

8. New seats would force everyone to have the same sized butt.

9. The airbag system would ask "are you sure?" before deploying.

10. Occasionally, for no reason whatsoever, your car would lock you out and refuse to let you in until you simultaneously lifted the door handle, turned the key and grabbed hold of the radio antenna.

11. GM would require all car buyers to also purchase a deluxe set of Rand McNally road maps (Now a GM subsidiary), even though they neither need nor want them. Attempting to delete this option would immediately cause the cars

performance to diminish by 50% or more. Moreover, GM would become a target for investigation by the Justice Dept.

12. Every time GM introduced a new car, car buyers would have to learn to drive all over again because none of the controls would operate in the same manner as the old car.

Cheers

Paul

3175. Wanted: Ultima 4 and 5 for Atari ST cash or trade (boxed complete only)

Newsgroup: comp.sys.atari.st
Date: 2001-03-03 19:03:29 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <9848bt$lu1$1@nnrp2.phx.gblx.net>
Source record: 49226

I am trying to collect all the Ultimas for the Atari ST, so far I have been fortunate enough to find the hardest ones, 2 and 6 (actually have 2 6's) , and recently found Ultima 3 which should arrive soon. If anyone has Ultima 4 or 5, complete in box, for Atari ST, I will pay either $25 cash for each one or trade my extra Ultima 6 in a box for one of them.

If you have these 2 games and have other ideas for cash or trade deals let me know and we can work something out. I collect for every system from Fairchild Channel F to Atari Falcon 030 and I am sure to have at least some of the things on your want list. I have over a $15,000 collection.

I do not need everything to be in perfect condition, a little box wear is OK, I just want it to look descent, and not smooshed or creased badly or anything.

> it require?

Don't see how the computer can play a guitar. Provided the keyboard
has MIDI you just need a pair of MIDI leads and a sequencer program
You can then use the ST to record etc.

>
> I understand that Cubase and Notator are the sequencers of choice, is
> there any freeware, shareware that comes close to this? What is really
> needed software wise?
>

I don't think any shareware comes close to this. I used to use the COSH
sequencer
which was freeware. You should be able to download easily. There were
various other sequencers available on cover disks. Sequencer-1 seems
to be of note.

>
> I am now using a PC, what is the best way to download to a disk so the
> Atari can read the disk, I can't remember anymore?
>

If you have double sided drive the ST can read PC formatted 720K disks.
Anybody know if ST emulators like WINSTON and Gemulator will
read and write single sided floppies? I would think they should.

> Is it possible to pick up any of the stuff I need in the Toronto,
> Ontario Canada region?
>

I would think so. Any good music shop should gave midi leads.
You main problem is that if you want to print scores
the ST is limiting. You really need a hi-res mono monitor
to do decent score work. You may also find it hard to

get a printer that works with the program you want to use
in a decent resolution.

These are analogue copiers.
They work by taking the "data out" from one drive and gating it to the "data in" on another.
To make the copy they need to get both drives spinning at the same speed and "in phase"
That is the "Index Mark" which marks the start of the track should pass the head at the same time.

There are two (at least) types of disk these won't copy. Physically Damaged, where a physical defect in the
disk is made, and ones where the last sector on the track overlaps the end of track.

>available for this system? What kind of amplifier speaker system would
>it require?

Okay, the Atari can do everything you want to do using MIDI apart from
'play' the guitar.

However, a close approximation can be accomplished by using a MIDI
guitar system. These vary from the dire (Casio DG-20) to the wonderful
(Roland's VG system) - and usually take the form of a computer/sound
module that interprets the frequencies you're playing and makes them
into notes. It's an expensive thing for a hobbyist (except for the DG20,
but that senses pressure on the fretboard and basically sucks as a
guitar, and sounds /horrible/ as a synth).

The Atari will play MIDI back into a sound module or synth. For guitar
parts, you find something that sounds appropriate, or you could just
record /everything/ using MIDI, but then re-record without the guitar
section and play that bit live when putting stuff onto tape.

A long time ago when I bought the commercial version of GT Look 2, it came
with a progran called GT Scan 3.0, using this program turns the scanner into
a photocopier, it's supposed to work with a Atari Laser printer or EPSON GQ
laser printer. I''ve never owned one of these so I have no idea how good it
is and what it offers. Since it's been written in 1993 I think it only can do
black&white and perhaps grey levels...

Cheers from Belgium

>Is it still being developed? It'll be really nice if someone could
>help them out with the Falcon problem.
>All the other software drivers for scanners, or even HD's, work fine
>on all the ST/TT/Falcon range, so why not on this particular driver.
>Must be something quite simple I would guess.
No, unfortunately not. The author has left our platform since years. The last
version of the program was written in 1993, and in the docs the author can't
guarantee the program would work on a Falcon because it has a different SCSI
mapping then the TT (whatever that means...). Since a Falcon was pretty rare
in 1993 I suppose he couldn't check it out.
AFAIK the only Epson scanner driver that works on a Falcon is GT-Look...

I have two more Epson GT scanner drivers here, but these are both commercial
and I haven't got a clue if they work on a Falcon... one is a German app
called ScanDesign and comes with a Epson GDPS driver written by TMS software,
the other app Studio Scan comes from France and was released by EuroSoft.
If anyone here knows how to get in touch with the authors, let me know so I
can try talking them into releasing the drivers as freeware...

>for sale (with SCSI and/or Parallel) and wondered which are the better
>models to go for ie that stand a chance of working with GTLook (in the
>absence of any other suitable software?
Every Epson scanner build since 1987 that has a SCSI interface will work with the GT Look and Epson GDPS drivers including the Perfection 1200 (which I've got) and the new Perfection 1640.
Forget about the scanners with parallel interface, they need a custom build interface which isn't available anymore and are "veeeery" slow. There's not really " a better" model, some are build to withstand worldwar III (9500) and some seem to flimsy build (5000), but softwarewise they all work equally well.

>I will be doing it again soon.
Since MagiC and MiNT both need to be booted from the Auto folder, the easiest solution is using a boot manager like Xboot. Create three setups (TOS, MagiC and MiNT), and point the config files of MiNT to the SyQuest disk where you put all the relevant files...
A boot manager is one of the essential utilities. Once you've got it running and are used to it you'll never want to be without it again. (a bit like a woman really...) <grin>

>keytbls is rather easy but nevertheless one have to add stuff and so in
>order to get MagiC running properly.
Hm... I can see your point however it depends from where you bought MagiC. If
it's a German version it will come with a German keyboard layout, the French
and English versions come with suitable layouts...

Remapping the keyboard is as simple as replacing the keyboard file in the
extension folder with a suitable one, there's no need to change anything in
the config file...

> this really necessary, or would just the 'z' do?

atz is probably enough, but at one time I was getting delays in the hangup process on CiX, so I implemented these commands in the hope that it would speed things up. As you know, with the method of billing used by CiX, the speeds I was connecting at and the size of the mail packets I had, it was possible to just slip over into the next minute and get billed double the amount per connection.

Below are the meanings of H0 and &C1 to explain why I chose them.

H - Hook Command Options

The H command provides control over the line relay. Its most common use is with the H0 option to initiate the Hangup Process and place the modem on hook. H1 takes the modem off hook.

H0 Execute the Hangup process if in the "on-line" command state or the local analog loopback and analog loopback self-test conditions.
H1 Go off hook; do not execute the Handshake Process.
H2 Operate line relay only (applies to certain Smartmodem 1200 products).

&C - Data Carrier Detect Options

The &C command determines how the state of the DCD lead relates to the carrier from the distant end. The command will take effect immediately when issued. The behavior patterns for DCD depend on the specific &C and &Q commands in effect. Also, DCD patterns depend on whether on-line operation is half or full duplex. Finally, if &Q5 is in effect, DCD behavior depends on whether S10=255 or S10<255. DCD circuit operation is according to the descriptions below.

DCD Behaviors for Full-Duplex DCD Behaviors for Half-Duplex
Operation Operation

&C0 &C1 &C2 &C0 &C1 &C2
&QO A B D &Q1 E C C
&Q1 B B B &Q2 E C C
&Q2 B B B &Q3 E C C
&Q3 B B B &Q4 E C C
&Q4 B B B &Q5 A E A
&Q5 A E A &Q5 A C F
&Q6 A B D S10=255
&Q5 A B D
S10=255

See Legends that follow for explanation of table entries A-F.

Table Legend:

A The DCD circuit is ON at all times.

B DCD=0 in idle; DCD tracks carrier in On-Line State with S9

The DCD circuit is OFF while the connection attempt is being made. It goes ON immediately after the CONNECT result code is issued, and goes OFF immediately after loss of remote carrier. If the remote carrier is restored and the S9 (carrier detect response time) delay is completed before the S10 (lost carrier to hang-up) delay expires, then hang-up is avoided and the DCD circuit goes ON again as the modem goes on-line. Otherwise, DCD remains OFF during the hang-up process prior to the result code message. If S10=255, hangup will not occur unless initiated by the DTE.

C DCD=0 in idle; DCD tracks carrier in On-Line State without S9

The DCD circuit is OFF when the modem is idle. It goes ON immediately after the CONNECT result code is issued, and goes OFF immediately after loss of remote carrier. If the remote carrier is restored, then DCD will go ON regardless of the S9 value in effect.

D DCD=1 in idle; DCD tracks in On-Line with S

The DCD circuit is normally ON when the modem is idle, and it is ON while the remote carrier is present and the modem is on-line. The signal goes OFF immediately after loss of remote carrier. If the remote carrier is restored, then DCD will go ON again regardless of S9. If the Hangup Process is initiated by the DTE using DTR or issuing ATH<CR> from the on-line state, then DCD will return ON just prior to the modem issuing the OK result code. If S10<255 (lost carrier to hang-up delay) and a timeout equal to S10 expires before the remote carrier is restored, then the hang-up process begins during which DCD=0.

DCD will return ON again just prior to the issue of the NO CARRIER result code. If the remote carrier is restored and the S9 delay is completed before the S10 delay expires; then the modem does not

hangup, and DCD will go ON again when the modem returns on-line.

E DCD=0 in idle; DCD=1 in On-Line State (no tracking)

The DCD circuit is OFF when the modem is idle in the command state. DCD goes ON immediately after the CONNECT result code is issued, and it goes OFF when the modem begins the hangup process. DCD does not track the presence of remote carrier energy.

F DCD=1 in idle; DCD tracks in On-Line without S9

This behavior pattern is associated only with (&C2, &Q5, S10=255, half duplex), and it only occurs at 4800 and 9600 bps when Express 96 is in effect (Hayes proprietary V.32 half-duplex operation (Ping Pong)). The DCD circuit is normally ON when the modem is operating in half duplex and idle in the command state, and it is ON while the remote carrier is present in the on-line state. It goes OFF approximately 3 seconds after loss of remote carrier. If the remote carrier is restored, then DCD will go ON again (regardless of S9). If the hangup process is initiated by the DTE using DTR or escaping to command state and issuing ATH<CR> when on-line, DCD will return ON just prior to the modem issuing the OK result code. The modem will not begin the hangup process if S10=255.

It's important to understand how the development process works, so I'm providing a long post of the kind of feedback that has taken place on this project in previous versions.

I can also reveal a picture of the hardware platform that will run this software. Please do not divulge outside this newsgroup because it is subject to a very strict NDA.

To Simon at Universe Systems
Thanks for the sky upgrade, the colour seems to be correct now, however I seem to have lost the sun. This was a bright yellow circular object that moved across the sky from time to time, bringing extra light and warmth. I was fairly sure that it was part of the operating system and not just an add-on.

Also can you confirm that LeavesTM. will be available by the end of March?

Andrew Watkins /~newland/

Andrew -

Rather than upgrade the sun, we thought we'd redefine the moon. We're currently beta-testing UniverSys Orb(TM) as a one stop replacement for all your natural light needs. UniversSys Spring(TM) is in pre-release and will be rolled out in mid-March. Thank you for using UniverSys Products!

Simon

Subject: Re:Puce Sky
To: simong@cix.compulink.co.uk

Simon,
Whilst I am looking forward to the exciting features of Spring 96, I am still a little uncertain about some key points.

1) Will Spring '96(TM) really contain new features such as Leaves, Flowers, Lambs etc. or will it just be the same as Winter '95 with a few colour changes.

2) Can you confirm that all Frosts will have been removed by the end of the beta period.

3) I only have a 5metre garden, will this be sufficient to be able to run Spring'96(TM).

4) Will this be a genuine UK Spring or an imported US one ?

BTW I still have a few complaints about this Winter. It only snowed here twice, but when it did it brought the whole country to a standstill. The snow was so dry that when I tried to build a Snowman. (as pictured on your 'Christmas Card' Brochure) it simply fell into a heap.

I am beginning to think that four major climate upgrades a year is beyond UniverSys' capabilities. Seasons have been steadily arriving later and later since the 16th Century, The Thames never freezes now. and I have staff continually asking why they cant go back to 1968, 1976 or some other 'good' year.

Be aware that you are not the only supplier of climate and that my company is seriously considering moving out of the temperate region altogether.

Andrew Watkins /~newland/

Andrew -

Thank you for your enquiry about UniverSys products. I am pleased to answer your queries.

> 1) Will Spring '96(TM) really contain new features such as Leaves,
> Flowers, Lambs etc. or will it just be the same as Winter '95 with a
> few colour changes.

We have extensively reviewed Spring'96(TM) and are pleased to announce full backwards compatability with previous releases of UniverSys Spring. New features will include:

- all singing, all dancing daffodils on roadsides
- space on lambs for corporate information to reflect the commercial requirements of Spring.
- Improved unified lighting services from the new UniverSys Orb(TM) module (this replaces two products, UniverSys Sun(TM) and UniverSys Moon(TM).

> 2) Can you confirm that all Frosts will have been removed by the end of
> the beta period.

We believe that frosts will be beneficial to users in the early stages of Spring'96 in order to highlight other, more general, inconsistencies in

the product. We anticipate a service upgrade (provisionally called "Easter") in late April.

> 3) I only have a 5metre garden, will this be sufficient to be able to
> run Spring'96(TM).

Spring'96(TM) will run in an Environment Awareness Panel Micro-horticultural Development Space (previously known as a window box), although more advanced features (particularily the Trees addon) will require more space. As always, the greater the capacity of your garden, the greater your enjoyment of Spring'96.

> 4) Will this be a genuine UK Spring or an imported US one ?

Spring'96(TM) is an international product that has been enhanced to reflect the conditions and expectations of local users. We are confident that we have identified and removed the bug in Spring'95(TM) that caused latter parts of the UK release to adopt the characteristics of the Mediterranean release. Spring'96 includes a full implementation of Rain and a revised version of BankHoliday.

> BTW I still have a few complaints about this Winter. It only snowed
> here twice, but when it did it brought the whole country to a
> standstill. The snow was so dry that when I tried to build a Snowman. (
> as pictured on your 'Christmas Card' Brochure) it simply fell into a
> heap.

We are investigating the implementation of a number of incorrect Snow modules in the Winter'95 release, particularily the UK and Eastern Seaboard North America releases which appeared to have inappropriate settings for their specified geographies. I will pass your report onto the Project Director for Winter, Mr J. Frost.

> I am beginning to think that four major climate upgrades a year is
> beyond UniverSys' capabilities. Seasons have been steadily arriving
> later and later since the 16th Century, The Thames never freezes now.
> and I have staff continually asking why they cant go back to 1968, 1976
> or some other 'good' year.

We appreciate your concern about our release schedule and to that end have implemented for some years now a gradual phase-in rather than a roll-out to a deadline. I am sure that you appreciate that in designing and developing the Weather suite of products we are obliged to adhere to the standards of the World Weather Council to whom all such complaints should be sent.

> Be aware that you are not the only supplier of climate and that my
> company is seriously considering moving out of the temperate region
> altogether.

We hope that you will be satisfied with the operation of the UniverSys Weather range of products and that our market lead in supplying weather systems to this planet will not cause you to move to other, less stable

platforms.

Thank you for using UniverSys Products!
Simon

A 68000 processor at 8 MHz won't be able to put a whole lot through an ethernet card. Besides, he NE2000 design always puts a considerable strain on the processor. This makes the processor an effective bottleneck. Steve and his PAK'd MegaST would probably be able to attain higher speeds.
Still, one should never expect much from a 68000, regardless of the NIC (network card). My Mac IIci (030/25) gains a respectable 150 k/s with a Gatorcard, based on the same DP8390 design as the NE2000, and the result on my Amiga 1200 (020/28), equipped with a CNet CN40BC NE2000 compatible PCMCIA card is much the same.

I must say this project is just what I've been wanting. Perhaps someone could adapt it for the VME bus as well, considering that there is already such an interface for SMC cards, only it lacks STiNG drivers (It's an old project, so it only runs with the TUWTCP stack).

Yes I know that now, but a few years ago this was for my brother and
probably quite some other users too a nightmare. They bought MagiC(Mac)
directly from Germany and as outside Germany nobody use a German
keyboard he was in deep trouble indeed. I don't think this is mentioned
in the MagiC manual.

AFAIK, you Yugos had a far better time computingwise than most other eastern-bloc countries. After all, some people actually managed to import Sinclairs, and there was a homebrew computer culture as well as domestic industry, as opposed to the hopelessly retarded DDR scene.
Mind you, this is just what I've been able to read, but DDR micros certainly weren't impressive, not to mention hard to get.

You're absolutely correct on the IBM PC part.
As for the Dragon, I own one myself. Don't like it much, though. Nice
keyboard, but Microsoft BASIC. Proprietary joystick ports, too. If I only had
the Dragon 64 and a disk drive, I could at least run OS9.
Still, it's nice to own a 6809 based machine.

Hi Wolfgang

>Do you know any place where i can find a pirate version of MagicMac?

Try the police station, a lot of stolen goods can be found here, perhaps they'd like a chat with you whilst your there, seeing as your inclined to a bit of theivery.

>I used Magic on my Atari Falcon and would like to use it on my Mac now,
>too. But spending about 300.- DM for this OS is too much for me.

Maybe it wouldnt be so expensive if people bought legitimate copies intead of stealing it.

This echo doesnt welcome talk of pirate warez. I think you must be a bit stupid openly asking for stolen goods in a public echo, it speaks volumes about you and your personality.

Good one, but lets not forget, no one expects Microsloth to make puters,
and Intel isnt expected to write software packages, so why did everyone
expect Atari to provide software for its own creation!!!.

Harry,
My reference to MTU/MSS was regarding StinG's DEFAULT.CFG not Stik's!
Are you sayimg we can delete the MSS line in the Sting's CFG?
There must be a reason why it's still in there in the latest StinG pkg.

From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3AA27DFB.2A0D712B@chello.nl>
Source record: 49384

Hello

I have read all there was said on the topic.

I understand that both approaches should be present on computers.

Some give examples of how easy and efficient a CLI can be.
That doesnt help.
I will NOT use a CLI or TTP programs, simply because I dont like the approach.

I dont have my fingers close to the keyboard all the time. :-)
(Being a programmer I think they are most of the time in my hair. ;-)

I dont get payed for what I do on my Ataris.
I have my ataris for fun, I wont let me be forced to do things I dont like.

Thats all from me.

Message-ID: <00064fa3@fmlynet.org>
Source record: 49250

FamilyNet Newsgate

Hello Chris!

CS> Does anyone know how (if possible) to hardwire a
> 72pin 4 meg SIMM into the STFM ?

I'm not going to say it's impossible, let's just say it's
not likely to be straightforward. 30 pin SIMMs are 8 or 9
bits wide, but 72 pin SIMMs are 32 or 36 bits wide. Since
the STFM has a 16-bit bus, it's probably easier to use pairs
of 30 pin SIMMs.

CS> I managed to do it with 4 30 pin simms (used the STe
> design and hardwired into the STFM)

Well done! Did you make your own PCB for this?

Regards,
- Andy.

I for one could be very happy never seeing a command line, although I know they serve their purpose, and some actually like them (yuck!). I agree that both should be available on a good OS, but in the same way, the user shouldn't be forced to use a CLI if it can be done with a GUI as well.

>>> I had to edit my reply, because my initial response to this

That's a pretty low blow! I'm a GEM user. I don't like using command lines. And that means I'm a bigot?! What the *#@& is that?!?!

>> It sounds too much like flexible and efficient to the programmer.

> players, most programs which require graphics and extensive interaction. Yet I
> usually launch my image viewers from the CLI, since they don't require any
> interaction, just a file specification.

If that's what you like, more power to you! For me, I would never do any such thing, because a GUI is more intuitive *for me*. As far as I'm concerned, the keyboard is only usable for word processing, writing e-mail and news, and entering the odd bits of info programs need from time to time.

Otherwise, my typing skills aren't exactly great, and I can't be bothered with memorizing commands and file paths drawn out in text, when I can just as easily see it visually, instantly, and point-click-it's there.

>>> There are also many,
>>> many applications where a graphical user interface is not
>>> available.
>
>> GEM is available permanently on ATARI, you only have to write for it.
>
> It's a shame there is no good CLI at the same time. Why limit yourself to
> either?

Because I don't like them and only use them if forced to (often complaining and swearing the whole time, because I can't remember commands, mistype something, or have to go through extra steps to get something to happen that would just be a click away on a GUI).

condition, 1 sticks a little

MAGAZINES great deal! 53 USA Atari mags, 1 Atari disk all together in one $ 5
super cheap set! email for titles, shipping not included

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem $ 5
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 1200 baud Avatex 1200hc, incl phone cable, serial cable $ 3
add $5

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume $ 5
control, great starter modem for older computers, incl phone cable, serial
cable add $5

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem $ 4
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 2400 baud GVC, AC adapter, great starter modem for older $ 12
computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 56K v.90 SmartLink, AC adapter, software, incl phone $ 68
cable, orig box&manuals, great modem, serial cable add $5

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't $ 14
stay pushed in unless you hold it; fix or replace with a switch from Radio
Shack; otherwise works perfect with great picture

MONITOR color Atari SC1224 working $ 28

MONITOR color Atari various models working $ 28

MONITOR mono Atari various models dead $ 10

MONITOR mono Atari various models working $ 25

MOUSE Golden Image optical mouse, no ball, super light, amazing mouse! $ 1
minorly broken, button sometimes works and sometimes doesn't, and it often
doesn't want to move right; comes with special gridded mouse pad

MOUSE original Atari mouse guaranteed working $ 9

POWER SUPPLY external for 520 ST's $ 13

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best $ 2
with larger dot matrix printers, sturdy smokey-clear plastic

PRINTER SWITCHBOX 25-pin for modems or printers, broken or miswired: does $ 6
strange things

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI $490
cables

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with $ 19
ROMS (disk/docs/cable)

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $ 12
clock automatically every time you boot. Incl box, software and hardware.
Suggested retail was $57.95. Brand new. No guarentee on lithium battery
(estimated 10 year lifespan)

SW ADVANCED Art Studio paint program from Rainbird (disk) $ 1

SW AEGIS Animator animation generator and viewer (disk) $ 1

SW ASSEMPRO assembly language compiler (disk/docs) $ 1

SW BALANCE Of Power strategy game; manual needed (disk) $ 1

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 3

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 1

SW CRACK'ED game published by Atari (disk) $ 1

SW CYBER Studio Set - hundreds of dollars of great CAD/paint/render $ 15
software! cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02, cad-3d,
plotter & drivers, human design disk, cartoon design disk, cyber control
(disk)

SW DAC Easy Accounting software 2disk (disk) $ 1

SW DEGAS Elite - brand new! original disk envelope is unopened! $ 3
(disk/docs)

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 1

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below $ 21
(disk/docs)

SW DUNGEON MASTER includes Secrets of Dungeon Mastery book, considered by $ 1
some to be the best ST RPG game ever! (disk/docs)

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms $ 1
and pathology recognition (disk)

SW EZCALC good spreadsheet (disk/docs) $ 1

SW FLEETSTREET PUBLISHER v1.0 3 disk set, top notch DTP program (disk) $ 1

SW FSM GDOS 5 disks (disk) $ 1

SW GDOS original Atari version 2 disks (disk) $ 1

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as $ 1
an ACC or PRG, works with all word processors (disk/docs)

SW IMAGE CAT complete graphics cataloging system for all Atari ST $ 1
computers (disk/docs)

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black $ 1
plastic videotape style box with the company logo all over; slides into a
white Interlink box

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun $ 2
w/pixelated nudity by Sierra (disk/docs/box)

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 1

SW LIVRE Du Graphisme (disk) $ 1

SW M1 TANK PLATOON still the best tank sim out there, all original $ 4
manuals (heavy Microprose kind:) and box included, includes PC/DOS version too
(will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working
backup) (disk/docs)

SW MACRO Mouse by Antic, record mouse actions (disk) $ 1

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, $ 1
manual for Mergeit only (disk)

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable $ 1
(disk)

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need $ 1
a manual for copy protection (disk)

SW OMEGA strategy game by Origi (disk) $ 1

SW OSS Personal Pascal v1.02 (disk/docs) $ 1

SW OSS Personal Pascal v2 (disk/docs) $ 3

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual $ 1
for copy protection (disk)

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 1
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 1

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW STALKER 2 older version probably upgradable (disk/docs) $ 3

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 13

SW STENO 1 older version probably upgradable (disk/docs) $ 3

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 4

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 1
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 1
great car racing game with 2 bonus packs of cars! 4 disks, probably needs
manual for copy protection (disk)

SW TEST DRIVE by accolade (disk/docs) $ 2

SW UIS Universal item selector v1.0 the best file selector replacement $ 1
(disk)

SW UMS Universal Military Sim, looks great especially in mono $ 2
(disk/docs/box)

SW UVK Ultimate Virus Killer (disk) $ 4

SW WARP9 speed up the graphics on all TOS machines lots! (disk/docs) $ 8

SW WORD For Word crossword puzzle creator (disk/docs) $ 1

SW WORDFLAIR v 1.1 the integrated document processor (disk/docs) $ 6

SW WORDWRITER ST a fast easy to use word processing system from Timeworks $ 2
that can interface with their Spreadsheet & DB (disk/docs/box)

SW WORDWRITER ST by Timeworks great graphical wordprocessor (disk) $ 1

SW Z-RAM Diagnostics v1.1 for use with Z-Ram RAM upgrades (disk) $ 1

SYQUEST 44MB removeable hard drive w/1 cartridge in 2-bay (1 bay free) $ 55
"shoe box" style external case incl host adapter so you can hook this drive
directly up to any ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive. Incl DMA cable
and software. Everything you need to get going!

SYQUEST CART 44MB each in quantity of 3, no bad secs $ 15

SYQUEST CART 44MB no bad secs $ 24

SYQUEST CART 88MB no bad secs $ 28

SYQUEST CART 88MB quantity of 5, no bad secs except 1 cart $ 86

GOLF VIDEO VHS Improve Your Golf Game w/Richard Zokol, new shrinkwrapped $ 1

DAISYWHEEL PRINTER DaisyWriter 1500/2000 wide carriage, includes good $ 14
ribbon, has weird interface connector, seems to work but sold as-is

FLOPPY DRIVE 5.25" probably dead $ 1

FLOPPY DRIVE 5.25" tested, working $ 2

PRINTER SWITCHBOX auto & manual switch for 2 computers to 1 printer, $ 13
brand new in box, cables extra, MicroMice model AS-201

PRINTER Star NX-1000II, includes ribbon, plastic cover a bit broken $ 33

SIMMS 1MB 30pin, quantity 4 sold together $ 3

SIMMS 1MB 30pin, quantity 4 sold together $ 5

SIMMS 1MB 30pin, quantity 4 sold together $ 4

FamilyNet Newsgate

Hello Iggy,

ID> I think UNIX is a programmer's tool, not an operating system.

Unix (not an acronym) is an operating system, many implementations
of it come with good programming tools.

ID> A complete environment needs both, in unison.

For most desktop computers I would agree. For servers and certain
applications a GUI is not always beneficial.

ID> I, too, hate MS-DOS.

I don't. It's limited, but reasonably good at what it does. It's
started showing its age now, but still potentially useful in some
applications. It's also what GEMDOS is modelled on.

ID> Still, that's not the only CLI in the world, but it is rather
> to command lines what MS Windows 3 is to GUIs; an abomination.

In what way?

ID> There are good CLIs and bad CLIs. Both UNIX and MS-DOS belong
> to the bad category IMO.

Then you don't understand Unix, which is not a CLI.

ID> The CLI is great for file system operations, since it's much
> faster than the GUI. Similarly, it's got powerful pattern
> matching facilities...

Agreed!

Regards,
- Andy Ball.

Hello Henk,

HR> I understand that both approaches should be present
> on computers.

Desktop computers possibly.

HR> I will NOT use a CLI or TTP programs, simply because
> I dont like the approach.

That's fair enough, and I wouldn't force you to use either.
However, that does not excuse what you said about
programmers of text-based software.

HR> (Being a programmer I think they are most of the time
> in my hair. ;-)

'Being a programmer' you should know better.

- Andy Ball.

R.Andersson has made a patch which is supposed to let STing work with
AES 4.1 (called ra_yield or something like that). Look at STing web site.
IIRC I have tried it and it worked- but it didn't like being started from
auto folder (as prescribed), only from the desktop.

>>would be superb. Oh, and another gripe! Why the f**k do things intended
>>for use under MiNT always have to be placed in a TARed GZIP (.tgz) or

>
>Because it's much better then Zip and lzh.

Time and again this pops up :)

I agree it is better, meaning that a higher compression ratio can be reached.
But isn't the difference marginal- and sometimes nonexistent. Anyway, it
is aprobably as good an archiver as others. What I don't agree with
is archiving documentation for Mint beginners in this format.

3219. Re: FPU in a MegaSTE

Newsgroup: comp.sys.atari.st

On 2 Mar 2001 18:14:25 +, "Micka&#65533;l Pointier" wrote:
>I would like to know if any kind of 68881 or 68882 co processor
>can be plugged on a MegaSTE motherboard ?

Yes. Ataris with MC68000 can use a 68881 FPU in a "memory-mapped" manner.
AFAIK MegaSTE has a socket ready for the FPU. On a MegaST one would have to
use the expansion port, and on a ST one would have to improvise.

But BEWARE: MegaSTE also needs a GAL chip fo the FPU to work. I haven't
seen the schematics but I am pretty sure that the GAL does the address
decoding to do "chip select" for the FPU. In my opinion The GAL (hard or
impossible to find?) is not absolutely necessary, one might simulate it
with about three or four standard 74HCT** chips on a little board.

>Someone proposes me some of those chips, but I do not know
>if they are in the right "pin packaging" and if they are at the
>correct frequency.
>
>The chips looks like ST's MMU and GLUE chips but they have
>pins on the bottom side instead of on the borders.

BEWARE: this is probably the PGA (pin-grid-array) package, looking
from the bottom side as something like the left-side schematics:

```
* * * * * * * * * * * * * * * * * * * *
* * * * * * * * * * *
* * * * * * * *
* * * * * *
* * * * * *
* * * * * *
* * * * * * * *
* * * * * * * * * * *
* * * * * * * * * * * * * * * * * * * *
```

But! AFAIK MegaSTE unfortunately needs a (rare?) FPU chip in a PLCC package,
like on the right side above, but with more pins (exactly like the MMU and
GLUE chips in an Atari). I think that a PLCC <-> PGA adaptor socket
can be bought.

>For the frequency, they range from 16 mhz to 25 mhz.

I believe that MegaSTE provides a 16 MHz clock for the FPU, so anything
for 16MHz or slightly above should be fine. A 25 MHz chip would be wasted
on a 16MHz clock. Motorola specified lowest permitted clock frequency for
this chip, but I think that 16 MHz is inside 25 MHz chip's tolerance).
Theoretically, with a little hacking you may install a separate 25 MHz clock
for the FPU- you would have to feed the signal to the proper pin and

disable the clock from the main board. This should be relaible, as the FPU is designed to work asynchronously from the CPU. However, benefits from a 25 MHz FPU would be minimal. I have a 12 MHz FPU in my MegaST, and I have overclocked this FPU to 16 MHz. Generally, this gives only about 5% better performance than on 12 MHz, because just a fraction of time is used for floating point operations. So, in my opinion 16MHz FPU on this system is just fine.

Btw. the FPU needs about 200mA at 5V supply.

>Should I risk something if I plug one of these chips ?
>Some incompatibilities ? Things to setup ?

Absolutely nothing (if the chip is in working order)- except that the FPU will not work without the said GAL or other form of address decoding. If you DO make it work, you may expect a speedup of about 500-600 % on applications which heavily use the FPU.

And that's the next problem. There are not that many applications that recognize and use this FPU. Programs are usually compiled for the "co-processor"-connected FPU (needs a 68020 or higher), and that approaches the FPU differently (the Line-F instructions; H.Robbers has made a Line-F emulator which should mend this difference).

AFAIK, a FPU in a MegaSTE can be used by: DynacADD, Prospero FORTRAN (if linked with proper library), and programs compiled with Lattice C and Pure C are also supposed to use the FPU, as has just been explained to me (didn't try yet myself). There is a compatible FPU library for GNU C. I also found a game (STarball pinball game) and an astronomy program. There should be POVray versions compiled for this FPU.

Btw. this type of FPU connection is called "SFP004- compatible", named after some early FPU board. If you use TOS 2.06 and install the FPU correctly, a _FPU cookie with value 0001000 shoud appear automatically.

>your Atari, I can't see why you haven't got one.
>(NB: with "you", I don't mean you, Djordje. The Yugoslavian economy isn't the
>same as in Western Europe, America or Oceania)

That's true :(... but there are other minor problems: A) the extreme
rarity of Atari computers around here (e.g. I know only two people here who
still use them, and one of them is a rather unpleasant personality), so
it would be very hard to find a replacement; B) extreme unreliablility
of post service which would make it suicidal to order anything valuable from
abroad, and C) high prices of the clones for the performance they offer
(that's why I was advocating a good emulator on i86 or a cheap i86 "clone").

That was the point in posting it here.
Not many users have stock machines:)
TT's can use some PGA's Falcon accelerators both 030 and 040's
TT some TT fx cards utilize PGA 882's
and it goes on and on.
Lets be positive here!

3223. Misc Atari ST Items FS (USA)

Newsgroup: comp.sys.atari.st
Date: 2001-03-05 01:24:15 UTC
From: Fred Horvat <fmhcom@operamail.com>
Message-ID: <3AA2EABF.322265AF@operamail.com>
Source record: 49395

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Snoopy The Cool Computer Game by The Edge. Snoopy, Woodstock,
and the rest of the Peanuts gang. Linus has lost his blanket
and Snoopy has to find it. Comes with box, docs, and disk
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$45.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk
$15.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
Sept 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run.
$20.00

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

Hi Martin,

>Not so long ago I heard another bell ringing from you.
>Tell do you still using TOS nowadays? I thought you're a MagiC-user.
I'm an Atari-user who uses MagiC as mainstream OS.... You've only listened to that bell I occasionaly ring, but never listened to the tune it played. I don't want to get rid of TOS, on the contrary, a computer without TOS is not an Atari. In fact a computer with TOS inside is the best guarantee we have that it will be a "real Atari clone". While we're on the subject, you do realise I hope that without TOS you wouldn't even be able to run MiNT? There's still life in TOS, just look at the Milan... everyone seems to be concentrating on either MiNT or MagiC, but give TOS an improved AES and a better looking desktop, and it remains a very usefull OS.

To answer your question: yes, I still use TOS on a regular base. A lot of older but usefull applications are not suited/adapted to run under MagiC. It's like I said the other day, I don't really care under what OS my apps run, as long as the job gets done...

Cheers from belgium

LOL. The "Atari Drop Fix". I never thought of doing that. Next time for sure. I've opened the case and re-seated the chips on at least five occassions. Maybe if I'd been a little rougher with it, I never would have had a problem. The floppy-head issue that someone mentioned isn't a problem for me since my system has an external floppy-drive. Certainly a concern if you have an internal one.

Thanks for all the responses. Comforting to know that I wasn't the only one re-seating chips. :-)

> arrived. No one bought them. Now shifting for £150 mint in box!

You're kidding, right? I just picked up an Aquarius at a flea market just for fun -- $10 (US) for the whole set! Tape drive, printer, extra RAM, carts, manuals, etc. It wasn't until I got home and started looking through the documentation that I realized I had almost every piece that Mattel produced!

Anyway, I'm not offended by the ridiculous poll that put Atari 7th on the list. I've spent the last 20 years trying to convince the "lesser beings" that Atari was a superior computer. Some people will never get it, I guess. Scale the 800 up to today's standards and watch the sparks fly.

Back in '81, I had a friend gleefully showing me how he could draw a stick figure on his computer, then make him do jumping jacks like in the old Circus game. I just invited him over, turned on the TV, popped in Star Raiders and watched his jaw drop in amazement.

Believe me, those of us that were there back then truly understood what we had, regardless of what the uneducated snobs said. Today isn't any different. When I pull up the emulator at work, my coworkers snicker, until I let them play a few rounds of Lode Runner. Then they're begging for copies of it.

It's never about fancy graphics. Maybe at first, but then people realize the graphics and sound can't compete with great gameplay. Let's face it, MULE ain't much to look at, yet people still rave over it. Star Raiders might as well have been black and white (in my house, it WAS black and white until I got my Commodore 1701!) Archon was about the same color as puke, yet we kept coming back for more, night after night, because we knew what a great machine and great software we had.

Screw the Techtv poll. People are always quick to point out their bad experiences (especially in a poll that asks for it). Just keep booting your Atari, day after day, and prove to the world that it will never die. Let them write into future history books that the Atari computer is the oldest living system in the world. And be happy that you own one. The rest of the world will never know what we know.

Play hard and fast,
Steven

>on that batch (and the chips were made by TI, notning less !). There was
>no hope of maing the device work until we replaced those TTLs.

That's always fun. :-) My "Monsterfile" was something I cobbled together in a bit of a hurry. I had to gut the Megafile and replace that cheapo 50w power supply Atari supplied, and since the drive I was using as a 5.25" FH I needed a new case, too. Unfortunately, the case had no covers for the gaping hole where the floppy and CD-ROM went, and my place being dusty as it was, it was easy for dust to accumulate in thick blankets in that case. Cleaning was a pretty regular thing -- or it would have been if I had actually bothered to clean it regularily. :-)

You need a good shell. One with file completion, first of all. Then, it's much
more intuitive and visual. Even a CLI shell may incorporate GUI elements.

>>>> There are also many,
>>>> many applications where a graphical user interface is not

I think much of the dislike of CLIs stem from bad CLI experiences. If your
only CLI experience is MS-DOS or one of the more limited UNIX shells, one's
dislike of it is fully understandable.

John N Oakes wrote in message ...
>Hi Again.
> Is the bloke Brian Henderson who developed Routefinder, still
>contactable.

I'm not sure, the last time I had contact with him is probably getting towards at least five years go (it was just after V2.1 was released) and then it took an age for him to reply as he works on oil rigs, mainly in the north sea I think, but IIRC in his response he appologised for the delay in responding but he had been working in the Middle East for 6 months.

At around the same time as this I was planning on releasing some map updates along with a format for writing them that hopefully all users would take up so that we could exhange information in a format that we could all understand. Why?, because most people will make additions/changes for their local area either as a result of changes made by the DOT or to increase the maps accuracy, this would then allow other users to update and increase the accuracy of their own maps without having to purchase a new road atlas every year and then try and spot the changes themselves.
It would then be up to the users to choose which (if any) of the supplied changes/additions they made. After this initial release I was hoping that users would document and send their changes/additions (using the stated format) to a central point (not necessarly me) where they would be colated and stored until a reasonable number had been collected (and if possible checked for accuracy) and then uploaded to a web site for others to use.

At some stage I became distracted with other projects and after that I started to turn the program that I was writing to colate and organize my original files into something else which I'm hoping to get finished the end of March 2001.
It should be easy to convert it back and use it for the Routfinder updates as most of my map files are finished (I think I can still find and understand them), should any other Routfinder users be interested in seeing this idea compleated.

> I would like some information about the software NoDESK, which was
>a alternative desktop.
>

I've never heard of NoDESK, however if you ment NeoDesk then read on.

NeoDesk is a replacement desktop and one that allows you limit the amount of memory it takes (256K minimum), if you have and older TOS version it will allow you to perform functions available on later TOS version, like placing runable program files on the desktop instead of having to dig through different drives and folders to run them, it also allows you to use the Ctrl+Alt+Delete key combination to perform a reset.
Other features include a corner clock on the menu bar, a recoverable trash can and the use of background images on the desktop, you can also unload and reload it as necessary to free up the memory if you need to. It will also interupts and trap many system errors that would normally result in a crash and print them on the screen, a simple key press will then return you to the desktop.

You really need a hard disk to run it.

The last time I had a query/suggestion and sent it to Gribnif they said that there were no plans to upgrade it any more, this was a couple of years ago, you should be able to find out more about it from Gribnifs web site at http://www4.pair.com/gribnif/

It's possible it is still used in STiNG but I doubt it. It is an
easy formula to use. In fact if you are using PPP with STiK2 you can
ignore all most all of these settings and go with the default and let the
PPP negotiation set it all for you.

Have you heard the audio "ad" or not? Whether or not it ever becomes real
is another thing, but, I can at least try to see if I can get Infogrames to
do something more with Atari than use it as just a brandname on software
titles.

But no, the product(s) do not exist yet, but infogrames would, obviously, be
the parent company of Atari... in any form. Just as JTS and Hasbro were
before.

GEM was the original OS for the Atari ST. But then lots came down in later years. I'm not including Unix-dirivatives like MiNT, because they basically "patched" GEM with multitasking, especially after Atari got a hold of it.

I'm talking completely separate OS's, not requiring or used in GEM at all.

If a new Atari computer was built by the Infogrames-Atari, which OS would you want it to run? What CPU would you want? How much and what type of RAM, Classic Atari case or PC-style tower with slots (for the very first model; do you think it would be worthwhile to make a really powerful all-in-one integrated system like the old 1040/Falcon030 to help bring recognition back with the new system, or going with a totally different minitower w/ slots type design to keep "expansion users" happy, regardless if it meant development headaches for driver programmers because anyone could have any hardware and thus no one would know who had what hardware)?

I still believe the first new system should bring familiarity along with it, as well as power/performance. And an integrated system can do that. Just look at some of the PC's Radio Shack sells. No bigger than the base of a 15" monitor! Tiny, man! And, I bet they have intgrated audio and video that is nowhere NEAR the power that an nVidia GeForce 2 chipset nor Yamaha or SoundBlaster Live carries.

But, of course, all of this is meaningless drivel if Infogrames does nothing, just as Hasbro did nothing...

> more intuitive and visual. Even a CLI shell may incorporate GUI elements.

Have you seen a good shell lately? Even on the commandline centered Unix
systems there aren't any. Ofcourse, the bare minimum is filename completion,
but then with some sense please. When I am using the cd command please don't
suggest filenames as possible completion. But then it realy starts, what
options are possible and usefull? And diven a particulair option which extra
options are the still usefull?

On Unix systems the information is available the shell can refer to the
manpage of the command you have typed to give you the necessarry help. But
this isn't done.

Sounds to good to be true? Well in the old ages of computing there were
CLI's already working this way. Example: the
TOPS-20 COMND JSYS (see also http://home.wanadoo.nl/i_a/tops-20/).

The problem is that all is focused on GUI's thinking CLI's are a closed
book. The BIG advantage of GUI's is that they are really easy to use for
beginners, but they can become a real annoyance for the experienced user.
CLI's have a very steep learning curve but they are the quickest way around
when you know what you want to do.

No, Neodesk isn't what he ment. Nodesk does exist alright. I've used it
as registrated user quite some time. It was for its time far ahead of
the other replacement desktops. The only drawback was that it needed
quite some efforts to set up properly. Almost everything could be
altered to your needs. It also came with a nice set of Icons.
I can't remember why I stopped using it.
The development of Nodesk has been dropped soon after I got my
registration key.:-((

If you "by number" mean an Xref: line similar to mine above it's inserted
by your isp's newsserver.

I'm also getting lots of old duplicates that show up as new articles.
Today they were from 21/2-2001. They appear both in Atari Newswatch and
pc Outlock Express. All the international groups I follow suffers from
this but none of the Swedish ones. Looks like there is some
missconfigured server somwhere or something. It's been going on for a
week now and is a bit annoying.

And I forgot to add that PLCC to PGA foot print
adapters exist. One reason might be to install
a 50Mhz PGA '882 into a Falcon that
might otherwise be limited to a 40Mhz PLCC chip.
Same with the CPU's. With a little research, one
can find an adapter to fit most standard chip types
into different footprints.
Why in Digikey, there is even an adapter that will
allow me to fit a Falcon COMBEL (SMT) into my Sparrow
that is fitted with a PGA type breadboard COMBEL.
What will they think of next:)
What's a Sparrow? :)

I think you might be a little confused here. From what I understand,
MiNT "patches" (but actually replaces most of) the GEMDOS, which is
not actually GEM. The OS doesn't even require GEM (the GUI) to be
run. MiNT works dandy as a CLI operating system.

And if you rule out MiNT, you rule out the AES's, which also do not
require GEM. These include MultiTOS (which is actually multitasking
GEM), Geneva, N.AES, XaAES (my personal favorite), and OAESIS. These
do not require GEM in ROM and, other than MultiTOS, do not use any
actual GEM code. Again, this is my understanding, so if anyone sees
that I have made a big mistake, let me know.

Now MiNT most definitely does not require GEM because it can run
natively on the Macintosh (without any GUI). It can operate using a
little chunk of software called JET (Just Enough TOS). This little
program definietely does not contain GEM. I think that MiNT only
requires some of the hardware I/O routines in TOS to run.

Also, the other UNIX derivatives, such as Linux/68k and whatever BSD
can run on the atari do not even use a bit of GEM. They don't even
have GUI's (except Xwindows maybe?). So these are entirely different
operating systems not requiring a bit of GEM.

Other than that, Magic is an entirely different OS. And I don't know
a thing about it, although it is supposed to be pretty sweet. ;-)
I'd like to try it out some day, but, alas, I can't afford it.

So you might want to consider MiNT. It really seems silly not to
include an OS that a large percentage of Atari owners use.

GEM is not an operating system. The Atari OS is called TOS. A more or less complete list of alternative OS's can be found at atariuptodate.de. Only NetBSD has been updated in recent time.

> If a new Atari computer was built by the Infogrames-Atari, which OS would

Infogrames is a games company. They'll built games, buy other game companies and don't care about anything else. We'll be lucky if they keep the Atari brand name for their classic revivals.

A heavy object fell on my 1040STe last night. Here I am typing a newsgroup posting on the poor thing.

When I run Notator SL, the MIDI data isn't being transmitted to my synth. I'll try re-seating any socketed chips, but the most crucial feature of this device may be toast.

If any of you have a 1040 STe or a Mega 4ST to sell, please e-mail me at:

ag352@chebucto.ns.ca

Thanks.

And now I'm talking to myself :-)

I jumped the gun a little in announcing that the BBS is fully back online... At the time, I hadn't fully restored all the filebase, however, I've done most of it now, but be aware that most of the ST files are old (I stopped supporting the ST in '96). However, if the older stuff is of any use to anyone, goto telnet://commodore.thebbs.org

cheers,

Lance

Hello Jeff!

JA> From what I understand, MiNT "patches" (but actually
> replaces most of) the GEMDOS...

Interesting. Does MiNT run as a MacOS application, or as a
stand-alone operating system on the Mac?

JA> Now MiNT most definitely does not require GEM because
> it can run natively on the Macintosh (without any
> GUI).

Even more interesting! Where can I find out more about
this? I'd love to try it!

JA> It can operate using a little chunk of software
> called JET (Just Enough TOS). This little program
> definietely does not contain GEM. I think that MiNT
> only requires some of the hardware I/O routines in
> TOS to run.

Is JET open-source? If MiNT works mostly through BIOS (and
XBIOS?), perhaps JET is a BIOS emulation for the Mac. Does
MiNT also use bits of GEMDOS?

[Atari Unix ports]

JA> They don't even have GUI's (except Xwindows maybe?).
^^^^^^^^
It's best to call it Xwindow, the X window system or just
plain X. I understand the X community don't like it
referred to as 'Xwindows'.

FamilyNet Newsgate

Hello Iggy!

ID> UNIX is constructed out of a programmer-centric
> perspective.

That's probably fair.

ID> ...but when it comes to administering it, it's just
> one long headache.

I'll readily agree that many unix implementations are far more difficult to administer than they should be. Hopefully this will change.

ID> Actually, I refuse to choose only one. Why shouldn't
> a GUI be beneficial on a server?

Many servers run 'headless', without a monitor and keyboard. Although it's possible to run graphical software on these and have the display directed across a network to another machine, I can't think of many 'server-side' programs that would really benefit from graphics. They may exist, I just haven't needed them so far.

I'm reminded of a DEC AlphaServer 2100 we ran at one place I worked. It comfortably supported about 200 simultanious OpenVMS users. It lived in a computer room where few people ever went, and routine administration could be done from a command line. Ironically the machine permanently ran a graphical user interface (an X server), although the only thing ever on its screen was an emulation of a text console. The system resources used by the GUI were probably not extreme, but they were still wasted.

ID> MS-DOS is appalingly limited.

It's certainly limited. Whether or not that appalls you presumably depends on whether it's adequate for the application you have in mind for it. I'm certainly glad it's not my only available operating system! ;-)

ID> Because it hasn't evolved since 1981.

DOS has evolved slightly. I imagine the command line itself has changed little since PC-DOS 2.0, and the addition of heirarchical directories and I/O redirection.

AB> Then you don't understand Unix, which is not a CLI.

ID> And neither is MS-DOS, then.

Technically you're right, COMMAND.COM is.

Regards,
- Andy Ball.

BBS Express ST; ICD;
+NEW in BOX.....$15.00 U.S.
==========

Hello Jeff,

below is a listing from my Catalog's inventory. Obviously it's for BBS Express ST's version for back when ICD had it. I'll hold it if you wan't to buy it. For a long time, I've been wanting to setup a BBS again. I have my own copy of BBS Express ST, registered and complete from the guy who last had it. If I start my BBS again, I'm not sure which BBS Software to run on my BBS? I have BBS Express ST but I like a BBS with Rooms and Floors like Citadel or STadel, or maybe Fnordadel or ST Keep. I do have an alternative and it's Y2K compatible, and I have a registered copy, the BBS Software I last ran, all setup on my Hard Drive. I stopped using it out of anger. I supported this Shareware and the author for years. I shut down the BBS, in anger, when the author dropped all support and shut down His BBS. This may not sound bad, but I was Generous with my support. I wanted him to add support for my 7 CD Changer CD ROM into the BBS so I rased the Money from my BBS Users to buy one and I sent it to him, in exchange for his work writing in support. Plus at the same time, for his support, I sent him a lot of New Jaguar stuff, listed below. A Jaguar with Jag CD player and 20 Games, all new in Box. And immediately after he received all my Jaguar and my Nakamichi 7 CD Changer, he dropped support and moved on and he never returned my stuff, even though he said he would, he stopped talking to me. I couldn't reach him anymore. The Nakamichi CD ROM was paid for by contributions from my BBS users. I've been disabled since I was hospitalized in 1980 and dealing in Atari is a mere pittance of supplemental income. Still, I bought all that for Brian in exchange for support on His BBS Shareware. And he drops support and stops talking to me and I don't get my stuff back either. And I can't afford to take such losses. Pardon my ranting, but I've never been able to get over this and I get off on this tangent, while on the similar subject of BBS. My Point is, the alternative to BBS Express ST could be ForeSight BBS, I think the Demo is on umich.edu. But my registered copy is Y2K Compatible, and it works and is nice. Drawback? A friend of mine warned me when choosing BBS Software, Pick BBS Software that works, as it is and don't pick what isn't finished or unworkable. I supported Brian and Foresight for years but he dropped support before it was finished. And unusable. But, still it's Y2k Compatible. I hear Brian still has his Atari Computer. Maybe he could get back to finishing his BBS, even though he told me their wasn't enough money in it anymore. It really is fine BBS software. I loved it, supported it and even sweated over it, keeping it to work. If Brian Hauer could be persuaded to pick it up again, and complete the BBS Software Foresight. I really love it, but as it is, it's incomplete and unusable, but still

beautiful. If someone could or would finish it. It would be a MasterPiece.
Brian, if only you would. Regardless, dear Readers. Please disregard. I
haven't slept in over 36 Hours and soon the Medicine will take
effect. Good night everyone as I Crash and Get some sleep.

Hi Dan,
Tried StiK2 but found no obvious difference in download speed or
time-outs at 115,200 betwwen StiK or StinG. From other's comments here,
it may be the Falcon's port itself, the hardware in my Falcon's port
and/or the phone line quality. It does'nt look like there's a software
solution at this point.

I'm Partial to BASIC. If STOS is Falcon Compatible, I'd use that as it was made for Writing Games, along with STAC, which I think is the same, accept used as an adventure creator. Or, ST (A)dventure (C)reator. STAC. If STOS will work on a Falcon, I can sell you STOS. As far as STAC, I'd have to look and see if I have it.

As a former professional VAX-BASIC programmer I'd say anything but BASICs with line-numbers ;-) There's a games-library for GFA Basic, and Reservoir Gods has released a games-library for PureC (or was it Lattice?) that's Falcon-only.

>longer make FPU's.

That GAL is in no way Motorola-related. AFAIK it performs address decoding
and the starting address of a memory-mapped MC68881 FPU is computer-specific.
On an Atari it is $FFFA40 but on some other machine it may be completely
different. However, knowing the pinout of the GAL socket in the MegaSTE,
I suppose you may get someone to burn a compatible chip for you.

Try these pages :
Atari FAQ - connection part
http://bales.online.fr/atari/#q41

The Atari Guide to Network Connectivity
http://gallery.uunet.be/saka/atari/faq/slip_faq0.html

Furthermore, you'll find more info about your topic on these pages :
http://obooklage.free.fr/e_intra.htm
http://gallery.uunet.be/saka/atari/lan/router.htm
http://gallery.uunet.be/saka/atari/lan/nfs_atari-pc.htm
http://www.mcs.drexel.edu/~unsilva/bredroll/magic/network.htm

Since I don't know what OS you have on your Atari nor your PC I pointed
to a few of them talking all about different OS's.

There are still a lot of other reference pages, but they all talk about
the same things.

From: Raoul Teulings <rt@xs4all.nl>
Message-ID: <983910190-746301AEicMi@xs4all.nl>
Source record: 49214

Hi,

Does anyone know the right way to connect an
EPSON GT-8500 scanner and ZIP to a TT running
HDDRIVER 7.7 and MagiC 6.1? I've used to have it

connected for several years but got it
unconnected due to a moving from one city to
another. Yesterday I plugged everything in, made

a few scans and the computer froze; no cursor
and only the startup from GTLook II. I made 2 or

3 scans. And afterwards it was hard to start up
the computer because it looked like this
corrupted HDDriver..Does anyone ever had the
same problem and/or has anyone any suggestions?

Thank is advance,,,,

The best language is the one you already know. If you don't know any basic
may be the best starting point.

Hans

No, the FPU is no longer in production, I rang distributors here in
Melbourne and they say 680x0 and 6888x are history. I know just about every
body makes gals, Phillips etc.... But Motorola ONLY produce PPC/coldfire
chips now. Hence Milan 2 and Rudolph's source problems.

>Express ST's version for back when ICD had it. I'll hold it if you wan't
>to buy it. For a long time, I've been wanting to setup a BBS again. I have

My version is newer than that, so I have no need. But I am
tempted, just for yucks in having a new copy in a box :) (When I bought
it, I only ever got a old ICD manual in a bag. I dont' recall where I got
it from :P)

>my own copy of BBS Express ST, registered and complete from the guy who
>last had it. If I start my BBS again, I'm not sure which BBS Software to
>run on my BBS? I have BBS Express ST but I like a BBS with Rooms and
>Floors like Citadel or STadel, or maybe Fnordadel or ST Keep. I do have an

The *citadel series really was cool, but very hard for users to
understand, i found. I always liked Express and Forem.. more limited, but
at least they worked. (nolonger true.. Express is y2k weird, but it seems
to work well enough. Forem is busted.)

>Software I last ran, all setup on my Hard Drive. I stopped using it out of
>anger. I supported this Shareware and the author for years. I shut down
>the BBS, in anger, when the author dropped all support and shut down His

Can't blame themfor dropping support; there hasn't been any money
in the Atari computers for a long time.

>him to add support for my 7 CD Changer CD ROM into the BBS so I rased the
>Money from my BBS Users to buy one and I sent it to him, in exchange for

Message-ID: <l_dp6.8$n07.1446@newsfeed.intelenet.net>
Source record: 49219

Hey, persistance is a virtue... or is that patience? Um, hmm... :-)

If we do nothing, nothing happens. Are you genuinely *happy* about the state that "Atari" (whatever that five letter word represents anymore) is in these days? Are you jumping up and down with glee that the only thing left are faint efforts to push "Atarism" a few months further down the road into oblivion? And, to what end? To live in the past a few more days? To make ourselves believe we're "still up and coming" to the rest of the world?

Pah!

I will not venture down the road of death. But I will try to bring the dead back to life... time and time again, if for no other reason than the fact that no one from Infogrames (previously Hasbro) has stated absolutely, that such things will NEVER be done or that Atari is dead and gone.

I am working on sending a letter to Infogrames (a local California branch) with the diskette. But... there are several CA branches to choose from. Which one do I send to? Is one just as good as another? Decisions, decisions!

Not sure if it will net any response or reaction of any kind, but... what's a couple sheets of paper, a few minutes of my time, a 1.44Mb floppy and about $1.00 in postage in the grand scheme of things? Surely not enough to consider it a waste of time.

Think about it. If everyone here (or in the Atari community) made the same effort to their local Infogrames offices, surely they would respond one way or another.

As long as we offer ways to bring Atari back, without it costing Infogrames a ton more money to do so (with the possibility that it might MAKE them tons of money in the process), why should it be something they wouldn't consider?

Think about it. If Infogrames called on Rudolph Czuba (sp?), could not he design the next Atari system? Or Milan, for that matter? Surely they've done the reseach, so Infogrames doesn't have to. As far as design, that could be a joint effort. And marketing needn't cost millions if you know where to place your advertising dollars to get the most for the least.

The only thing that might be a large expense is FCC Class B approval. I know that's a requirement in the US, for consumer-grade devices. Not sure elsewhere.

It takes only a few dollars and an hour or so of your time to help bring Atari to the front of Infogrames awareness. It's up to them, after that, but at least, either way, we will have given it our best.

And THAT, Steve Sweet, is why I refuse to stop returning time after time. I will not stop hoping and trying until someone at Infogrames says there is no hope. And, at that point, you will hear and see the last of me...

>options are the still usefull?

Bash IIRC won't suggest files when tabbing cd, though I find that behaviour rather annoying, seeing as I use the file completion features as a quick alternative to ls a lot of the time.

>On Unix systems the information is available the shell can refer to the
>manpage of the command you have typed to give you the necessarry help. But
>this isn't done.

The manpages are a nice idea, but why are they written in such a backwards, programmer's manual manner?

>Sounds to good to be true? Well in the old ages of computing there were
>CLI's already working this way. Example: the
>TOPS-20 COMND JSYS (see also http://home.wanadoo.nl/i_a/tops-20/).

I've heard good things about TOPS-20, which has made me evaluate UNIX even lower than before.

>The problem is that all is focused on GUI's thinking CLI's are a closed

>CLI's have a very steep learning curve but they are the quickest way around
>when you know what you want to do.

Some CLIs are even part-GUI. KingCON on the Amiga pops up a file requester when using tab completion with multiple alternatives. A CLI doesn't have to be a black 80�25 screen.

I had a phone repairman replace all the connectors at the box on my house (was corroded!). He also reduced the extra lengths of wire at different connection points eliminating as as much as 1000 feet of loop. Don't see a difference in computer rates at 56k. Maybe later in the night I'll see some improvement. What bother's me mostly now is the difference between Rx and Tx rate. At 56k, my modem Rx is about 45k and the Tx is about 26k. Falcon port hardware problem? Or is this normal? 115k is still a disaster!!!

I must say, Jared, I admire your tenaciousness! I, however, feel you'd get a lot farther if you tempered your enthusiasm with something to offer other than blind hope! For instance, offering to handle the marketing yourself or the construction of the blueprints yourself or offering your finances to a qualified technician to build a prototype or build the prototype yourself!!! This would show Infogrammes something tangeable!!! But, like I said, I admire your tenaciousness!!! Have you tried Gates???

I liked Citadel because each room had a subject that could support
Files, Messages, Doors & on-line games and you could group rooms into
floors. Like Rooms for Games, Utilities, etc. Grouped into different
floors like Atari 8 bit, ST, Commodore, Amiga, Apple, Mac & PC.

> extension?
> John G.

These are StuffIt archives from the Mac, the equivalent of Zip on other platforms. There's an old Atari program to unstuff SIT archives, but the format has changed so much over the years that I doubt it would work anymore (even back then the program choked on some archives). Besides the Mac, StuffIt Expander is also available for the PC, so if you have access to such a machine the files can be extracted. Whether what's inside will be useful, however, is another story. If the SIT files are from a friend, tell the person to use MacZip or ZipIt instead.

Hello,

in article <pTgp6.1720$oz.187322@newsread1.prod.itd.earthlink.net> (comp.sys.atari.st)
John Garone wrote on Wed 07-03-2001 02:17 (GMT):

> What bother's me mostly now is the difference
> between Rx and Tx rate. At 56k, my modem Rx is about 45k and the Tx is
> about 26k. Falcon port hardware problem? Or is this normal?

It's normal to have such a difference. V90 gives:

Rx = up to 56000 bps (note "up to", as 56000 is only reachable in
laboratories). 45k for Rx is not so bad.

Tx = up to 33600 bps, similar to V34 (it can be reached).

A low Tx rate as yours is a sign of a bat quality line somewhere. It can
be anywhere between your end and the TelCo equipments.

I used to have the same problem (low Tx and average Rx) in one location
and not in another one, with the same Falcon/modem.

Bye,
/Pascal/

Actually MacOS is simliar to TOS in some ways. That may sound strange
but the Mac's Extensions Manager is really no different than X-Boot (or
any other boot manager that allows preset configurations); both use
control panels, the system folder is essentially the auto folder, and
applications are generally confined to one folder or made up of a naming
convention that makes it easy to find other related folders.

With time I've found that uninstalling Mac applications is just a little
bit more difficult than under GEM. MacOS is much more convoluted, of
course, but it strikes me how some things aren't dissimilar. MacOS is
less hands-on with less to tweak, but by no means should the machine
rule you.

My best guess is that you've either:

1) Knocked the soldering loose on the midi ports or...

2) ...somehow broken the ACIA, maybe by shielding bending and touching
a track.

Who knows? Option 1 sounds most likely.

Hmm, I have a Falcon, ZIP 250 and GT9500.

You may have possibly damaged something.

I'm no SCSI expert so I put it as:

Falcon--------ZIP 250------Scanner (terminated)
ID 7.00 ID 6.00 ID 5.00

ZIP is unterminated

Everything works fine (except for the flakey Falcon :)

It depends on what you mean by Falcon Compatible, the new STOS loader
(Basic207.prg) by Anthony Jacques is STOS fixed for all TOS versions and
will allow you to run STOS on a Falcon, it defaults to ST Medium res if the
Falcon resolution is currently set to ST Low or Medium or to ST High if the
Falcon is set to any other resolution.
Anthony also wrote the Falcon extension that allows you to use the extra
resolutions and hardware of the Falcon, unfortunately Anthony is no longer
developing this or updating his website but you should be able to download
both the loader and the unregistered version of the Falcon extension from
his website at
http://www.btinternet.com/~AnthonyJ/

That's perfectly true, in particular if you haven't got gtraphics hardware
(the server we run at the computer club has only got a CGA card), but
otherwise, why not?
I must admit, though, that when I'm administering my TCP/IP stack, I just use
a text editor instead of the fancy GUI setup, but even the text editor does
run in a GUI. After all, that's what X was invented for; running several
xterms at once. =)

That's true, and thsat's one good point of having a CLI - remote
administration is infinitely easier.

ID>> MS-DOS is appalingly limited.

> It's certainly limited. Whether or not that appalls you

Yep, those are the major user-side features to crop up in MS-DOS. Version 2.0.
It went up to version 7.

AB>> Then you don't understand Unix, which is not a CLI.

ID>> And neither is MS-DOS, then.

FamilyNet Newsgate

Hello Jared!

JF> GEM was the original OS for the Atari ST.

Not exactly, GEM was arguably part of the ST operating
system. It's fair to say it was the original user interface
for the ST.

JF> If a new Atari computer was built by the Infogrames-
> Atari, which OS would you want it to run?

That's probably unlikely, but it makes an interesting
hypothetical question. I'd probably opt for a unix variant
like Linux or BSD, but with a sensible default configuration
and a user interface that made it unnecessary for the user
to mess with the innards.

JF> What CPU would you want?

Perhaps something 64-bit, it's sad that so many PC users are
paying for 64-bit motherboards, and then putting 32-bit
processors on them! :-(Probably a 64-bit PowerPC variant,
aided by at least one DSP.

JF> How much and what type of RAM...

At least 64Mb, commonly available SDRAM on a standard DIMM.

JF> Classic Atari case or PC-style tower with slots...

Hmm... probably a standard microATX case and power supply,
preferably one that isn't butt-ugly (I've been trying to
find one, and it's not easy!) These are inexpensive, and
if most of the functionality is built into the mainboard
lack of expansion shouldn't be a worry, especially if it
had firewire and USB ports. It should take standard PC
keyboard (USB or PS/2, probably the latter) as these are
very cheap. F11 and F12 should be relabeled 'Help' and
...was the other button 'Undo'?

JF> (for the very first model; do you think it would be
> worthwhile to make a really powerful all-in-one
> integrated system like the old 1040/Falcon030 to help
> bring recognition back with the new system, or going
> with a totally different minitower w/ slots type
> design to keep "expansion users" happy...

None of the above.

JF> ...regardless if it meant development headaches for
> driver programmers because anyone could have any
> hardware and thus no one would know who had what
> hardware)?

It would make sense to use an existing operating system,
taking advantage of its device driver development.
Application programmers should work through the operating
system, not talk to the hardware directly.

JF> I still believe the first new system should bring
> familiarity along with it, as well as power/
> performance.

I doubt familiarity would be a primary design consideration.

JF> Just look at some of the PC's Radio Shack sells.

No thanks.

Hello Jared!

JF> Are you genuinely *happy* about the state that "Atari"
> (whatever that five letter word represents anymore) is
> in these days?

The state of death? Atari did important and groundbreaking stuff, and the ST series really did deliver more power for less cash. The industry has changed a lot since the 80s though, and it would be a real challenge to produce competitive hardware. It may make sense only if you target a niche market (in the Atari case, music seems an obvious choice).

JF> But I will try to bring the dead back to life...

An ambitious aim.

JF> ...for no other reason than the fact that no one from
> Infogrames (previously Hasbro) has stated absolutely,
> that such things will NEVER be done or that Atari is
> dead and gone.

There's probably no reason for them to limit their options by stating that it (hardware design) won't be done.

JF> I am working on sending a letter to Infogrames (a
> local California branch) with the diskette. But...
> there are several CA branches to choose from. Which
> one do I send to? Is one just as good as another?
> Decisions, decisions!

Head office would seem a more obvious choice. You may want to verify ahead of time that they can read the format you're submitting. I can't help thinking a well researched business plan might evoke more response than an audio clip.

JF> As long as we offer ways to bring Atari back, without
> it costing Infogrames a ton more money to do so...

I imagine software is more attractive to them because of lower overheads. Development costs aside for a moment, it must cost a lot less to manufacture a CD, inlay and jewell -case, to warehouse them and distribute them. These days much of that may be farmed out to third parties anyway.

> could have any hardware and thus no one would know who had what hardware)?

I think that this one could be a kind of iMac, whitout screen and not
another
sad PC box !
This machine should be a Home Computer, with an easy GUI, with a very
little
OS as MagiC built-in, a PowerPC, USB ports for keyboard, mouse, printer,
etc...DVD and Modem inside, and perhaps just one expansion slot. This
one
should work with a standard TV, and computer monitor. this machine could
be
a personnal computer or, whihtout keyboard and mouse, just a console as
dreamcast.

Not expansive, 380 Euros, not more. But i think, i can expect walk on
Mars
tomorrow instead of to get anything from Infogramme about Atari ;-)
It's too late.

And it's very expansive to develop such system, and with
Sony, Nintendo and microsoft...How to get somes part of market for a new
computer/console as in my idea ?

While I didn't post the first message. I believe what these are
is the original lego robotic kits. Lego tried to introduce them in the
mid to late 80's with very litle success. If anyone is really interested
in the new setups there is open source software to program these devices
that could easily be ported to our platform.

Misinformation. MiNT is being updated all the time. It is about
to version 1.16.0 now (unreleased yet).

Since version 1.15.0 MiNT does not replace 'most of' GEMDOS, it
just replaces the entire GEMDOS, and most of the BIOS.

I doubt this version works on a MAC. The MacMiNT archives contain
version 1.12.4 or something like this. Stone old stuff.

3323. Re: Submission to Infogrammes...

Newsgroup: comp.sys.atari.st
Date: 2001-03-07 16:07:30 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <51tp6.63$n07.7757@newsfeed.intelenet.net>
Source record: 49150

If Infogrames would LET me handle design, I would. If they'd let me handle marketing, I would. If they let me handle the whole blazing show in a boat, I gladly would, in a heartbeat. Just give me the money to do it (and I'd gladly research how affordably each step could be done) and watch me!

It's not impossible... it's just takes convincing! And, as I've outlined in my last message, how much time and money does it take to have each person interested, write to their "local" Infogrames branch. However, if Infogrames has it's own agenda and refuses to budge, we're no better off with them than we were with Hasbro, which would be sad.

I've signed the letter, I've got the diskette folded in. It's only a matter of getting my wife to weigh the letter and stamp it with her postal machine, and it's off.

Of course, deciding if I go with the Northern California address or the Central California address is the tough part. If I had the time/money, I'd send a letter to every branch of Infogrames, but that wouldn't probably accomplish much in a positive way. I think it best if we all simply band together and let them know what we want from "Atari". Just make sure that you ask them to make a statement one way or another, concerning if there is any chance they would consider our proposals.

We've already got the people who can build the motherboards (Rudolph Czuba, Milan, etc.), it's a matter of getting Infogrames to see our point of view and go with it... or hand it over to us (as a collective effort for them) to do and help get it done. I speak of "us" as not just myself, but the entire Atari community, provided enough of us can agree on each step done.

If no one else raises their voice in this effort, it surely will NEVER happen. If we work together, it MAY happen, provided we can convince Infogrames of the viability/affordability of it. I will send a copy of my letter via Email to anyone interested, if they want to see how I worded my message.

Nay-sayers are those that say it can't be done because they refuse to believe it can be (or have been lead to believe it can't be done, by other nay-sayers) and won't try themselves.

If nay-sayers convinced everyone they spoke with, would we still believe the world was flat? Would we still be driving horse and buggies? Would we still be using the Abacus? For every dreamer who helped bring about change, there is a nay-sayer that says it's impossible or isn't worth trying.

Being "realistic" and "logical" and "sensible" sometimes isn't right in the face of man's need for progress.

This is no different. It's just a matter of how you look at it. If
something is worth doing... it's worth doing. And, unless someone else
absolutely takes the dream from you, there is still hope.

I'm willing to try to keep hope alive... are you?

"Lemming or pioneer... what'll it be?"

You don't compete with the big boys, lest you fail completely. It's not about market share... it's about brand loyalty and reviving a product we can use that is better than anything "Atari" we've ever used before. If the name "Atari" means nothing to you anymore, then this entire venture is meaningless. But brand-name loyalty is worth pursuing. Look at Sony. Nintendo. Sega. Kawasaki. Yamaha. Toshiba. Mitsubishi. Aiwa. GM. Pontiac. Buick. John Deere. Crucial. Micron. AMD. Intel. Microsoft. The list goes on and on, ad infinitum. For every brand name, there are people who trust and believe that name stands for something worth buying.

Is Atari any different? No.

The people who own a brand name are no more powerful than the people who buy a brand name. If no one bought Intel products, where would Intel be? If no one bought Microsoft products, where would Microsoft be?

And I will continue to talk myself blue in the face (oh, which reminds me, has anyone seen the latest Intel Pentium 4 commercial on TV? Blue Man Group is COOL!) until the door of hope is closed utterly and completely by Infogrames themselves. I just hope that never happens.

Hello,

I was able to make som DI image files for 800XLDJ from ATR image files by using a program that extracts files from Atari image disks. I was then able to import the raw files into DI image disks and have them boot on my 130 XE. I used some ATR Mega Disk image files. Now I plan to make some Mega DI image files. Anyone out thee using 800XLDJ?

In answer to John, the text was taken from a very old document. I
believe it applied to STinG too, but as Dan says, I think it's even
more applicable to PPP connections where many settings (including
MTU/MSS) are set by the PPP negotiation itself.

Some further notes I've found from Danny Bhabuta may shed a litle
light on where the settings came from in the first place and undicate
why some may not be so appropriate now. I hope it helps...

> Mind you, are there *really* any benefits in using PPP over SLIP? I
> hear many different answers to this one!

[Taken from some notes somewhere]

PPP is a newer protocol, better designed, and more acceptable to the
sort of people who like to standardize protocol specifications.

PPP has some additional benefits. Unlike SLIP (which can only
transport TCP/IP traffic), PPP is a multi-protocol transport

mechanism. This means that PPP not only transports TCP/IP traffic, but can also transport IPX and Appletalk traffic, to name just a few. Better yet, PPP lets you transport all of these protocols at the same time - on the same connection.

This is often not a concern for most users since their purpose of either using SLIP or PPP is to connect to the internet and the internet uses TCP/IP only. Therefore, there is no need to transport other protocols.

With SLIP, you have to know the IP address assigned to you by your service provider. You also need to know the IP address of the remote system you will be dialing into. If IP addresses are dynamically assigned (depends on your service provider), your SLIP software needs to be able to pick up the IP assignments automatically failing which you have to setup them up manually. You may also need to configure such details as MTU (maximum transmission unit), MRU (maximum receive unit), use of VJ compression header (ie., CSLIP), etc. All these can get confusing pretty fast.

PPP addresses this problem by negotiating configuration parameters at the start of the connection. This can greatly simplify the configuration of your PPP connection.

Most SLIP/PPP software can dial-up and automatically login for you. However, they often depend on your service provider's system sending out standard prompts (eg, "login:" to get the login name and "password:" to get the password). If they are any way non-standard, you either need to write a script to automate the login process yourself or login manually in the terminal emulation mode of your SLIP/PPP software.

PPP provides two methods with which logins can be automated - PAP (Password Authentication Protocol) and CHAP (Challenge-Handshake Authentication Protocol). Both provide the means for your system to automatically send your login userid/password information to the remote system.

The most significant advantage PPP can offer is the automatic login and configuration negotiation. With these features, your PPP software only needs to know your login userid/password and the telephone number of your service provider. The software can then dial-up into your service provider and figure out everything else on its own.

One last note: Some users believe SLIP is faster because the protocol format calls for a packet size that is 3 bytes smaller than a PPP packet. In practice, this difference is too small to be of any significance.

-Danny (www.cyberstrider.org)

Hum..Yes i expected in fact you right ! For me Atari means a lot
of things, and i like it...But i'm not sure that Infogramme will
do something really interresting for our small world :-/
Infogramme could be interresting about Hasbro interactive's rights
and licences that it got.

Parhaps use the Atari name to release again somes titles...
But i think that we can't wait anything about hardware and OS.

I expect really i'm wrong :-)

3346. CT60 STATUS

Newsgroup: comp.sys.atari.st
Date: 2001-03-08 00:35:23 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <ftAp6.2083$Om4.3358768@nnrp6.proxad.net>
Source record: 49181

Hi,

It's a long time I didn't send you a mail...

You are now 143 people registered for a CT60 !

The BIOS for the CT60 boot is ready !
The design of the logic is ready since February.

The chip ABE-60 was optimised and the SDR-60 (SDRAM controller) seems to be nice...
The data transfers performances are the ones that are on my web pages...They were calculated with the SDR60 capacities and the MOVE.L instruction execution time of the 060.
So,
A BURST READ/WRITE into an OPENED PAGE (HIT) gives :
- 8 / 7 cycles ---> 128 / 146 MBytes/s at 64 MHz !
A BURST READ/WRITE into a new page (MISS) gives :
-13 / 11 cycles ---> 79 / 93 MBytes/s at 64 MHz !
This last test assumes that each access is into a new page (CPU jumps over the page frontier).
This test is commonly called 'RANDOM ACCESS'.

Pages sizes are from 4 to 16 KBytes depending of the SDRAM DIMM capacity & model (see the table of 'SDRAM').

The next phase will be the ROUTING of the board...
Unfortunately, I have no more time to do that and it will not done before April....
My principle job since beginning of January is RIORED-J and it has the biggest priority in a market (and financial) point of view...

Next (good) news will be in April...

PS : the NEMBENCH 2.1 value still to be missing for the HADES WITHOUT EDO (FPM) into my table ! Thanks for your help.

Regards

3347. Re: FA on Yahoo Robotkits For Atari ST/Falc

Newsgroup: comp.sys.atari.st
Date: 2001-03-08 02:10:19 UTC
From: "john.masterman" <john.masterman@ntlworld.com>
Message-ID: <IEBp6.3381$sV.582368@news2-win.server.ntlworld.com>
Source record: 49182

Please excuse the tardy reply, only just noticed the link.

A box of a dozen of these Robotkits have found their way to me. They are, indeed as Mr Ackerman points out, intended to operate with Lego Technic. Each kit consists of a clear plastic cased cartridge port insert, a disc, and a book. I don't have enough books to cover each kit, but there are sufficient original discs... hence the offer of a PDF or photocopy of the manual on the auction page.

The software seems to be reasonably simple to operate and program. The robots you build with Lego Technic are represented in a few given designs in the books. Presumably afterwards you come up with your own designs. I really think that the cartridge units will be buffered switches basically. I assume that the connections to motors in the robots are simply switches controlled from the software... thats my reading from the manuals. However, it will not be lost upon you that if you can switch these motors off and on in pre-programmed sequences, then you should also be able to do the same thing with other devices... other than Lego Technic.

Email from the auction page by all means if you want me to dig a bit deeper. There is a lot of other Atari equipment which my lady has decided must not all remain with me. I can keep some of it, but not all. I think women are wonderful. I have been terrified of them ever since I can remember.

I've just fitted a 320M HD to a boxed and stock 4M Falcon, and am in the process of fitting a 540M HD to another which is in a tower case. This one starts with a larger screen area and apparently higher res in the memory count screen so it may have had a graphics addition to it. Can't remember... but it has an apparently stock Falcon external keyboard. Nice neat little case too, opens up like a clamshell... stands on one edge. I'd forgotten all about it. I tried two 2.5" drives until I discovered that they may format up and partition on a PC with bad sectors but the Falcon won't entertain them... not under AHDI anyway. The new 540 should be here tomorrow. Why did the AHDI decide to partition the 320M I fitted to four partitions of 86 Meg each?

What's the smart money advice? Hang on to them or sell them along with the STs? What do they fetch now?

There's a pile of STEs, STFMs, and a couple of Mega ST2s if memory serves me right and I do recall a couple of those ridiculous old Megafile HDs as well somewhere. Used to make cables for them out of 25pin D connectors. Wouldn't pay the premium for the 19 pin ones. I've found a Power HD for STs, and a Ladbroke twin case with one HD in it on an ICD Link I think. The STFM that came with it had an AT board in it which works. I recall an ST as well... first time I ever saw a third party twin drive system for an ST.

I even found the CD I made of all the ST software that ever came my way.
Copyrights must be out of date by now.:-))

Regards

John

PIC, I'm not sure. I bought my GAL programmer (for ST/Falcon/TT/
Milan) as PCB and software only. I've never got around to buying the
chips mostly 74LS stuff. I think I should really do it next time I
order from Farnell. The quality of the board is excellent. Software
was about 20 ukp and board was 25 ukp.

> replacement for TOS.

It wasn't clearly implied from your mail, that's why i called it a misinformation.
I can't see what is the sense of making a distinction between self-contained systems and those which use some parts of ROM. Sure it would be better if MiNT could also replace the entire BIOS (instead of replacing 'most of'). But it will never contain XBIOS (other than in a form of XDD module) or VDI (same). Different concept.

IMHO it is much better to be neven a 'incomplete', but working and still developed OS, than a 'complete' one which simultaneously is a totally dead project.

On http://wh58-508.st.uni-magdeburg.de, where is the main
FreeMiNT repository. You can e.g. download the current
source code, or check the latest changes made to the kernel.

You need gcc 2.95.2 to compile the kernel. This version of
gcc only works under MiNT which means you have to start
with binary kernels downloaded somewhere. The last
released one is 1.15.5, last released beta is 1.15.10. The
current alpha, as I said, is 1.16.0.

The project maintainer is Frank Naumann, fnaumann at the host
called freemint.de (this is his e-mail address :-))

> KK> Since version 1.15.0 MiNT does not replace 'most of'
> > GEMDOS, it just replaces the entire GEMDOS, and most
> > of the BIOS.
>
> Interesting. Is MiNT open source software? Also, does it
> come with TOSWIN?

Yes. MiNT is open source software since about 1994. Currently
it comes with TOSWIN2 and a number of other tools and modules
(tools for disk encryption, fdisk, several filesystems and device
drivers). There is also a full blown environment distribution based
on rpm modules.

There is also a freeware AES, although it is not a part of the
central repository and it is not yet very usable either. I mean XaAES.
Its maintainer is Henk Robbers, I forgot the e-mail.

e-mail: atari@benjamin.net

Lately I've added more Atari inventory so checkout my Catalogs. Even my 8 Bit Atari Software grew by 25%! And I'm offering a 20% Discount to my regular customers! E-Mail for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you & your Atari Needs. And if you have'nt bought from Bravo, Give Ben a Chance! I can be quite Beneficial. And remember, if you can't come see me today? Come see me tomorrow! E-Mail or call Ben anytime at (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Thanks for posting that. I'd checked it out before & it does look pretty promising. I'm sticking with my PSX for now & waiting for the X Box & Indrema (if it make it out) & will probably decide between those two. I do hate Bill Gates, Windoze, Micro$oft & generaly all things IBMish but I gotta say, it sure looks like the X Box will be the next big system. I'd sure like to see the X Box & Indrema split the market. Nothing against Sony but I'd say after 6 years of Sony domination I wouldn't mind a little change.
Later,

3362. Re: Submission to Infogrammes...

Newsgroup: comp.sys.atari.st
Date: 2001-03-08 17:43:49 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B6CD12EF.DA1A%nameerf@flash.net>
Source record: 49097

Jared,

I really do admire your enthusiasm. I would hate to see that crushed in any way. There's just one problem with having such a gung ho attitude. It often overshadows objectivity...

> It's not impossible... it's just takes convincing! And, as I've outlined in
> my last message, how much time and money does it take to have each person
> interested, write to their "local" Infogrames branch. However, if
> Infogrames has it's own agenda and refuses to budge, we're no better off
> with them than we were with Hasbro, which would be sad.

The unfortunate fact is, Hasbro didn't budge because they don't have a vested interest in producing or supporting computer hardware. Only software and perhaps a video game system if they were to bend at all toward your idea, even if you were to promise them they wouldn't have to do much work. Infogrammes (sp?) wouldn't be any different. They are a games company. Their purpose statement most likely prevents them from being involved in anything but games and entertainment. And those kinds of things you can't change with "convincing" by letter, petition, or nifty little jingle.

> Of course, deciding if I go with the Northern California address or the
> Central California address is the tough part. If I had the time/money, I'd
> send a letter to every branch of Infogrames, but that wouldn't probably
> accomplish much in a positive way. I think it best if we all simply band
> together and let them know what we want from "Atari". Just make sure that
> you ask them to make a statement one way or another, concerning if there is
> any chance they would consider our proposals.

If you don't have the time to send letters to every branch, you don't have the time it would take to handle design, marketting, or any part of the deal, as you mentioned. It takes a singular dedication of most, if not all your time to run a business. So unless you can get someone that dedicated, your plan's not gonna fly with anyone (Infogrammes, c.s.a.s people, any of the Atari supporting companies, etc.).

> We've already got the people who can build the motherboards (Rudolph Czuba,
> Milan, etc.), it's a matter of getting Infogrames to see our point of view
> and go with it... or hand it over to us (as a collective effort for them) to
> do and help get it done. I speak of "us" as not just myself, but the entire
> Atari community, provided enough of us can agree on each step done.

So basically, you're saying we have everything we need already? You've been saying we as a group have everything we need, Habro/Infogrammes/whoever doesn't need to be involved? Then why do we need them at all? It's this obsession with the Atari name again, right? Well, if that's so important,

then lets first get a machine built (which has already been done - Milan, Hades, etc.) and get it supported by software (modern software that is at least as good, if not better than everything on PC), then we can ask for the name. They aren't going to give up, or even share, something they paid millions for, simply because a few fanatics with a poor quality jingle and nothing else firmly in place say they should. That's just business sense.

> If no one else raises their voice in this effort, it surely will NEVER
> happen. If we work together, it MAY happen, provided we can convince
> Infogrames of the viability/affordability of it. I will send a copy of my
> letter via Email to anyone interested, if they want to see how I worded my
> message.

Even if they see what resources we do have, they won't bite. If a business is going to be associated with any venture like this, they will want full control, because they are staking *their* reputation on it. If the venture fails, it's their name that gets trounced on as well, which could be devastating for a business. So they would want control. They won't let people they don't know be in control of something they are associated with without being hired by the company. There's legal reasons for this as well. This would then mean that they would need to put in a lot more money than you are suggesting, and any company that cares about its bottom line wouldn't risk such an uncertain venture. It's not like if you and I got together, and you said, hey, if you put your name on this computer I make, I'll put in all the money and resources to make it. That would be a no-brainer. But when companies are involved, especially with intellectual property like a brand name and such, there are certain legal channels that must be gone through, and there must be a very specific level of company association that one must have before any physical or intellectual property can be simply handed over. Does that make any sense?

> Nay-sayers are those that say it can't be done because they refuse to
> believe it can be (or have been lead to believe it can't be done, by other
> nay-sayers) and won't try themselves.

It's not that I'm against what you are suggesting, just because it's not worth trying. I just know enough about economics and company policies to know they not only won't do it, they can't, unless we have a company already formed, they see it making headway, and purchase it as a division of their company, putting everyone involved on their payroll and having a say in what we do, which would require large amounts of *their* resources. Otherwise, they have no way of knowing what the heck we're going to do with their intellectual property.

> If nay-sayers convinced everyone they spoke with, would we still believe the
> world was flat? Would we still be driving horse and buggies? Would we
> still be using the Abacus? For every dreamer who helped bring about change,
> there is a nay-sayer that says it's impossible or isn't worth trying.

Convincing a company to put in their resources on a relatively unknown, risky venture is nothing like making a new invention. Your argument doesn't make logical sense. The dynamics of what you're comparing are completely

different.

> This is no different.

See above. Making an invention and convincing a company to take an enormous risk with its money and property rights are very different.

> It's just a matter of how you look at it. If
> something is worth doing... it's worth doing. And, unless someone else
> absolutely takes the dream from you, there is still hope.

I agree that if it were possible, it would be worth doing. Go ahead and ask Infogrammes. I'm sure they will tell you exactly what I'm telling you. It's not in their vested interest at the moment, doesn't follow their purpose statement, is too big a risk, etc.

> "Lemming or pioneer... what'll it be?"

Be a pioneer. Support the companies that *are* forging ahead with what Atari started. When you think about PC's, rarely does anyone think specifically about IBM any more, even though that's where it all started. The same can be true of Atari. So what if the name is lost. The stuff that really matters is still alive - the hardware and software. Pour your attention into these places if you really want to see some advancement in the platform.

FamilyNet Newsgate

Hello Iggy!

ID> UNIX is constructed out of a programmer-centric
> perspective.

AB> That's probably fair.

ID> To the programmer, not to the poor users.

I meant that your obervation was probably fair, mine was
not a comment regarding unix design.

ID> They've had nearly 30 years to change already.

Over 30 years, but obviously things have changed a lot
during those years. It's only recently that I have had
cause to seriously consider putting unix on the desks of
ordinary users. Before I do that, I would like to configure
it so that the user doesn't have to know, or care that it's
unix they're using (they'd never see the command line, let
alone edit config files).

ID> That's perfectly true, in particular if you haven't
> got gtraphics hardware (the server we run at the
> computer club has only got a CGA card), but otherwise,
> why not?

'why not?' is not (in my opinion) a sufficient justification
for the processor overhead and extra hardware associated
with a GUI (for servers). I would need to answer 'what
benefit does it yield?'

ID> After all, that's what X was invented for; running
> several xterms at once. =)

I doubt that. In any case, multiple terminal sessions can
be handled much faster, with less overhead, using 'virtual
consoles' in text mode.

AB> DOS has evolved slightly. I imagine the command line
> itself has changed little since PC-DOS 2.0, and the
> addition of heirarchical directories and I/O
> redirection.

ID> Yep, those are the major user-side features to crop up
> in MS-DOS. Version 2.0. It went up to version 7.

I never claimed those were the major features of MS-DOS. I
noted that they probably marked the most significant change
to the DOS /command line/.

ID> You're splitting hairs.

I do quite a bit of that. In this case I think I'm justified
since unix is more than just a command line. It's not fair
to reject unix just because one dislikes command line
interpreters, or one shell in particular.

Regards,
- Andy Ball.

This isn't really the place to ask, but I'm going to assume you plan to emulate an ST on it... :-/ If it's a standard form-factor mainboard (probably AT or 'baby AT'), just replace the mainboard with one that has a 386DX or 486 microprocessor.

Looks like a glorified PC? Personally I wouldn't bother. The fact that the Dreamcast has CE on it, means I won't buy it either. Who wants the hassle of potential hardware failings because it is based around substandard hardware? As far as I can see the best successor to the Jag is N64. Ahhhh Goldeneye.

Jeff,

I just e-mailed it to you.
IF you have a problem getting it or if anyone else would like a copy.. visit
the Atari-users.net ftp site..

ftp://ftp.atari-users.net/16bit/Apps/
the file is in the 16bit/Apps directory.

PLEASE feel free upload any files (LEGAL VERSIONS!!) to the ftp site.. place
them in the incoming directory.

Rob

nope,sorry.
my latest version is 2.3 i believe.
with regards to that i wonder if you have doug littles e-mail address.
In an earlier thread (when your address was phantomm@kih.net) you mentionned
that you might have it?
I ask because I sent my disks to be upgraded to the "Nemesis" release
to Chris Krowchuk of Computer Direct. He went out of business, my disks
were never sent to David Encill, and so I can't upgrade. I was going to
get the "Nemesis"upgrade(so called because it was an upgrade to take advantage
of Nemesis) for free, as the only reason I would get the upgrade was
because I had purchased the Nemesis board. I felt i was being penalized
for buying the Nemesis board if I had to purchase the upgrade for it.
That seemed OK with David Encill, but not OK if I no longer had the
original disks,
Now it occurrs to me that perhaps if I mailed my manual(and covered the costs
both ways) that might might be considered proof of purchase also, and I could
finally get my upgrade.
If you (or anyone here) has Doug Littles e-mail address, I would like to
write him and ask him about this.
thanks.merci
ken

3383. MagiCMac upgrade?

Newsgroup: comp.sys.atari.st
Date: 2001-03-09 03:53:23 UTC
From: Steven Kaleita <sakaleita@home.com>
Message-ID: <3AA853B3.A581A81F@home.com>
Source record: 49117

Can anyone tell me where or how, I can upgrade my version 6.01 of MagiCMac to the latest version (6.15)?

Without having to purchase the program all over again.

I sent ASH e-mail with no response!

I've tried to 6.01 to 6.04 free software upgrade, but keep getting a German message that I don't understand, and no matter what button I press, nothing happens. And the 6.15 upgrade only works on versions 6.1 and up.

I bought my version of MagiCMac from Systems For Tomorrow, but it doesn't appear that they handle MagiCMac anymore.

I should think that you could adapt one of the many serial port designs, the only issue might be that you'd probably have to adapt the design so that you could manually switch the 12V on that the PIC needs as a signal that it is about to be programmed.

So you should be asking "is there a compiler for the Atari". I think I saw something on a German site, but I don't have a URL.

There's nothing inherently wrong with a command-line, but why name the
commands flnr, sdn or dmesg?

ID>> That's perfectly true, in particular if you haven't

A GUI doesn't necessarily mean a lot of processor overhead. The Atari runs a
GUI in 8 MHz.
An apparent benefit from a WIMP would be the windows, so that one could edit
several config files at once. =)

ID>> After all, that's what X was invented for; running

That's exactly my point. That is what has changed in MS-DOS since, save for a lot of 386-specific tools and refinements of commands.

ID>> You're splitting hairs.

> I do quite a bit of that. In this case I think I'm justified

Actually, I think it's quite fair. It's not a matter of one particular shell, since all UNIX shells are basically alike. And it's not just the shell, it's the commands it is designed to run, and the files which it's controlled by.

I believe unSIT originated from GEnie around 1989, so that Atari users there could gain access to Mac image archives (mostly monochrome clipart). These were the days when commercial clipart was expensive. If I'm not mistaken, the program was written by someone at DMC Canada (now MGI of course) and then made available on GEnie, where Nathan Potechin's wife was a SysOp. She presented the program as a "special download". Since then the SIT format, originally written by a kid in his early teens, has gone through many changes, to the point where unSIT is obsolete.

Just bought a 520STFM second-hand, to play some of those old games and demos in their true environment :o)

But... the Atari mouse has broken, didnt realise until i tried it... one of the "wheel" holders inside has been removed, hence trying to move left or right wont work... anyway...the question is, can i just plug in a normal PC serial mouse or is the Atari one a peculiarity??

Hi all Falcon flyers.

My guitarist/composer son has attracted the attention of various bodies in the recording and music business with his CD and a professional recording engineer has just told him that his four acoustic guitar track/ 6 midi track CD, 'is the clearest acoustic guitar CD he has ever heard'. When told it was produced on a C-Lab MkX Falcon with Cubase Audio, the Engineer got in three of his colleagues to listen. Disbelief all round. He told Steven not to change to PC/Apple unless forced to.

Steven is getting a Web site set up by a pro, and I will make sure that ATARI is mentioned as many times as possible!!!!

Bob King.

Hello Iggy!

ID> There's nothing inherently wrong with a command-line,
> but why name the commands flnr, sdn or dmesg?

My understanding is that the original commands were terse because teletypes were slow. By the time CRT-based terminals became the norm, the habit seemed to be well established. I found DCL commands in VMS to be more easily understandable, especially for the beginner. When I went from Unix to DOS I fealt DOS to be 'long winded' by comparison. I guess an administrator is supposed to 'just know' what the commands mean, and most users should never have to mess with them.

ID> A GUI doesn't necessarily mean a lot of processor
> overhead. The Atari runs a GUI in 8 MHz.

Good point, I suppose a simple GUI need not be hideously inefficient, but still not as efficient as text mode ;-)

ID> An apparent benefit from a WIMP would be the windows,
> so that one could edit several config files at once.
> =)

That's pretty tenuous, you can do the same thing with emacs, or using virtual consoles, or having multiple sessions into the server.

ID> I've never seen that, unless you mean the kind you may
> only use one at a time.

It's very common on PC unix. In Linux for example you can press alt+F1..F6 (say) to switch (instantly) between sessions. I believe it's also possible from normal serial terminals and network login sessions, it may be slightly slower over a serial link depending on how it's implemented.

ID> That's exactly my point. That is what has changed in
> MS-DOS since, save for a lot of 386-specific tools and
> refinements of commands.

You're making me think now, I'd guess the major changes to MS-DOS would have been support for fixed disks, the V2 changes (heirarchical directories, I/O redirection), support for extended memory (a 286 feature), more than one partition, then partitions 32Mb-2Gb, Internationalisation,

task switching, networking and doubtless other things that I
have overlooked. I'm not a big fan of DOS, but it did evolve
slightly during its lifetime (not always for the better).

AB> It's not fair to reject unix just because one dislikes
> command line interpreters, or one shell in particular.

ID> Actually, I think it's quite fair. It's not a matter
> of one particular shell, since all UNIX shells are
> basically alike. And it's not just the shell, it's the
> commands it is designed to run, and the files which
> it's controlled by.

I suppose I can look at unix from two angles. From a server
-side perspective, it's reasonably efficient and the
complexity of its administration reflects its great
flexibility (although I welcome tools that genuinely make
life easier, like the binary package tool I use in NetBSD).

From a client-side point of view, unix probably makes a
good kernel, but I would choose to hide the detail (and the
shells) from the user.

ID> There are two major products that come from Berkeley:
> LSD and UNIX. We don't believe this to be a
> coincidence.
> -- Jeremy S. Anderson

<grin> Hmm... LSD, BSD...

Source record: 49054

FamilyNet Newsgate

Hello Paul!

P> But... the Atari mouse has broken...is the Atari one a
> peculiarity??

Congratulations on your 520 STfm, wouldn't mind one myself.
The ST uses a quadrature mouse, which used to be very common
on microcomputers. PC mice tend to be serial (even the PS/2
ones) or even USB. I've successfully used a PC serial track
-ball on an ST (with an appropriate driver) but it used the
serial port, which I really wanted free for other things. I
imagine someone here will know of a source for quadrature
mice, probably pre-wired for the ST. If available, it's
worth paying a little more for a pure optical mouse, as
mechanical mice are notoriously unreliable.

Regards,
- Andy Ball.

Probably so that the above-mentioned programmers would have to type
as little as possible- the commands were kept short.

Ah, the past pleasures of using VMS and its DCL command-line interpreter...
looked almost like conversational English when compared to a Unix
(or any other OS, by the way). Not to mention that VMS had a strange habbit
of running for weeks (or months) without crashing anything, or showing any
discomfiture at all.

Btw there may be another reason for the "unpleasantness" that exist
in Unices and, in another way, in Windows**: make the stuff appear very
complicated, so people would need the services of (well paid) experts and
those who are knowledgeable would attain an aura of God-like beings who
can find their way in the matters which mere mortals can't comprehend.

This attitude seems to flourish in a part of the Mint community, too
(they do not gat paid, of course). They almost look like a religious
group, going about their misterious business, porting and using appls
and utilities seldom heard of (and sometimes even less needed), and
condemning anyone who dares to interfere. I once received a spitting e-mail
from a certain lady (once posting to this group) just for complaining that a
new version of Infozip's Zip/Unzip is not anymore TOS compatible, while
the older one had been. The e-mail message amounted to: you ignorant moron,
go away and leave us alone.

Right, the 9 pin PC mice can be plugged in, with the right adaptor
into the modem port. But, it does require drivers, as TOS expects to
find the mouse in the mouse port.

But the problem is you say you want to play games. Most games won't
run under TOS, so the drivers aren't loaded. Most comercial games
only accept the mouse in the atari mouse port.

Mario Becroft makes an adaptor that plugs into the mouse port and uses
a PC mouse. It requires no drivers at all.

Exactly. Too bloody programmer-centric.

I'll have to try VMS... Whenever I get those ECC modules for the Alpha.
However, as far as I've seen, UNIX seems to have been rather particular
compared to other CLIs. According to what I've read, TOPS-20 also had a more
human language orientated syntax. AmigaDOS is much the same, too, with
commands and arguments such as "List QUICK SINCE Yesterday". I really hate the
UNIX way of supplying arguments, with totally nondescript one-letter
arguments.

>Btw there may be another reason for the "unpleasantness" that exist

After all, that is the entire reasoning behind the UNIX-centric open source
community. Give away the software for free, sell support. It's probably a
lucrative idea if your name is GNU, but it really doesn't encourage
development of user-friendly software.

>This attitude seems to flourish in a part of the Mint community, too

Well, at least that is a funny aspect about these large, complicated systems;
it's so easy to appear as a wizard to the lesser knowing. I can't see why
anyone would call you, Djordje, ignorant, though.

In actuality, the PC mouse is a peculiarity, usually using some kind of serial protocol and on-board logic as opposed to the raw quadrature data supplied by the Atari mouse for processing inside the Atari. You could, however, adapt a PC "bus" mouse, if you could find one. Otherwise, it's possible to use alternate and the cursor keys for moving the pointer, as well as alternative+insert for left clicking.

Anyone,
Does anyone know if ICQ works on a 1040STf with 2.5 megs of RAM?????? I have ICQ but it does not seem to allow me to verify my information when I go to sign up as a new user. I heard you need a program called SPAWNER if using STING to connect to the internet, is this the case??????? IF so where do I get this program and how do I set ICQ up then???????? Any help from people on this matter would be greatly appreciated. You can E-mail me at firest@williams-net.com

Thanks,
Carey

Anyone,
I have E-mailed the author of EVEREST. Expecting to find out if his address is still the same. If so I will post his address when I find out then everyone can register to the author of EVEREST so they may get that nasty title screen off. So hopefully I will find out soon. His E-mail address is oschmidt@gmx.de or you can e-mail him at oschmidt@math.uni-kiel.de either one should work.

Thanks,
Carey

Anyone,
I have been using GENEVA and NEODESK demos for the last 2 months off and on (the sample program). Although it is limited on some of its functions. It has interested me enough to consider buying this great software package. I have all the pertinant information.

Gribnif Software
(413) 247-5620
GENEVA 6.0 and NEODESK 4
p.o. BOX 779
Northampton, MA 01061-0779
USA

They also have a 1-800-284-4742 for technical help.

When purchased you get a detailed manual with everything to install this great software already setup and ready to go. Just install and reboot and your ready. I have seen the desktop and on the demo it is much better than TOS ever was if the full version is even better it is money well spent

Thanks,
Carey

3421. FS: Atari SC1224 Color Monitor $17.50

Newsgroup: comp.sys.atari.st
Date: 2001-03-10 00:35:03 UTC
From: TJ <amishman@pacbell.net>
Message-ID: <B6CEB6B6.6E0D%amishman@pacbell.net>

Good used condition. Works and looks good. Includes power cord, video cable, and I think I even have the user manual too. $17.50 plus freight.

I am in California.

Perhaps you doubt my sanity. But, contrary to popular belief, I know where to draw the line.

> >If Infogrames denies all possibility of revival, I will have no choice but
> >to give up hope and, yes, then THAT will be the last you see of me.
>
> As though you would let that get in your way.

Do you think I'm doing this out of sheer insanity? If Infogrames says there is no chance in 30 lifetimes that they will bring Atari back, what am I gonna do? Tell them they MUST do it because I want it more than anyone else? Pah! I'd be off my rocker. And I'm not. I'm just VERY driven to revive a company I know was wrongly executed by the very people who saved it in the first place!

Look, if Infogrames says "no", then "no" it is, and "no" it will be. And that will be the end of my efforts. I'm not striving to do this just for the fun of it.

sigh

Jared

Whilst reliving childhood traumas, O_v spied Neil Roughley's 09 Mar 2001 message...

>unSIT is obsolete.

Oh, really?

That's too bad.

FWIW, I found a copy of it!!

http://www.umich.edu/~archive/atari/Archivers/

The file is "unsit.lzh".

Hi Jim,
Found it like you said but it did'nt work! Don't know if I have a bad
SIT file or the program is too out dated.

Was Atari user until 1995.There were less than 5 programs,but at least one,which supported the MSTE FPU.The problem is that with a 68000-based system the FPU is accessed differently from a 68030,-040(TT),which had some FPU support by software.

3430. Latest Ghostscript
